Yes, I do bite my wife's butt every now and then as a sign of affection. I
also chew on her heels and feet, as well as my son's. Not to mention
burying my muzzle in that OH, SO SWEET AND YUMMY CENTER BETWEEN HER LEGS...
DELICIOUS! We wolves tend to be very mouthy creatures. Chocolate isn't
good for canids, but I sometimes break the rules... fudge is a tasty
treat... well worth the tummy-ache later.

> Well you've just proved your a complete no-know on this subject as well,
any
> frequency can be AM'd or FM'd

Ok... now did I say I knew *EVERYTHING* about AM/FM or frequencies
therewith? No. I stated what little I know. It may also not be
completely accurate or fully detailed, but it's something more than nothing.

> > Tirade? Nope, not from me. If you drop this topic, you'll see I will
too.
>

> We've found elsewhere that that statement is worth as much as your
technical
> qualifications.

We've found, EVERYWHERE, that you're, well... just plain worthless. If you'll remember, I am A+ Certified, not a radio technician or automotive mechanic or doctor of psychology or whatever else. That means I specialize and am qualified to work on computers, nothing more, nothing less. Though my general (*NOT* all-encompassing, mind you) knowledge of PC's, Macs, Ataris, and Amigas does help...

If you would be so willing to actually challenge me to SHOW you this proof of my certification, I will do so and shut you up for good on that one issue. Not to say I won't find a lot more to argue about with you, but...

Jared

The files on my web site are always kept up-to-date in the light of problems
found as they are used.

I recommend using them over the ones from ASH.

>I have had a chance to try Magic 6.20 on a 4MB MegaST (that is the machine
>with the Ricoh RP5C15 real-time clock). I could see no particular problems-
>but one: current time and date reported by the system and stamped upon
>any new files is completely wrong (some wrong time and a date in 2082,
>iirc).

I'm under the impression that Andreas released a patch for this problem, I
haven't had occasion to look for it on ASH's web site though.

>Btw. and slightly OT: the documentation for the 6.10->6.20 upgrade states
>that it should be performed on a partition enabled for long filenames- but
>it is not absolutely necessary: if one unpacks the update on a partition
>with only 8+3 filenames, the patch file will have some weird name instead

It also isn't really necessary to use the environment that's recommended to
unpack it apparently, but it's probably best to keep to the documented
method.

Cheers

Message-ID: <3d5489cc$0$253$4c56ba96@master.news.zetnet.net>
Source record: 32966

Hi !

There was a posting a while back concerning the the amount of
hard drive that a Falcon could access. Alas I did not keep a record
for future reference. Silly me !

Now I am in begging mode, hoping that whoever it was that posted that
information would be kind enough to repeat it for me please.

I am currently using a I Gig IDE. By how much may I increase this ?
What is the upper limit, or is the upper limit defined by the Falcon
and not the drive capacity,ie. will the Falcon ignore capacities on a
HD beyond that which it can access ?

Regards,

Paul.

There is no upper limit. With HDDRIVER IDE drives up to 127 GByte have
been tested. Drives with 128 GByte and more are also supported by
HDDRIVER, but have not yet been tested. See also
http://www.seimet.de/hddriver_english.html
Note that the operating systems limits the partition size. For huge
drive MagiC or MiNT have to be used in order to have partitions of more
than 1 GByte.

>Do I *have* to get an additional device, or is it just a matter of
>correct connection?

In most cases is a matter of correct connection, see below a collection
of notes that I collected long ago on this subject (note- some other source
stated that in the highres-to-vga connection the three resistors should not
have the same value. This affects colour balance; IIRC using three equal
resistors results in a rather "bluish" monochrome picture):

quote:

Connecting a real ST(E) to different types of screen, the complete
instruction!

The ST series has the following video connector:

4 3 2 1

8 7 6 5

12 11 10 9

13

1=audio
2=csync, or when the ST has a TV modulator, then it is composite video
3=port A bit 6 of sound chip
4=monochrome sensor, low = SM124 monocrome monitor
5=audio input (no a/d!!!, only mixed to audio out.)
6=green
7=red
8=+12V (TV can detect if a video signal is present)
9=hsync
10=blue
11=monchrome video = SM124
12=vsync
13=ground

Scart (Euro AV is the following:

```
------
1
2
3
4
5
6
7
8
9
10
11
12
13
14
15
16
17
18
19
20
--21-
/
/
```

1=
2=audio right
3=
4=5=9=13=17=18=ground
6=audio left
7=blue
8=+12V video in detect
10=
11=green
15=red
16=vsync
19=
20=csync

VGA has the following pin out:

```
\ 1 2 3 4 5 /
\ 6 7 8 9 10 /
\ 11 12 13 14 15 /
```

1=red
2=green
3=blue
4=not connected
5=digital ground
6=analog ground for red
7=analog ground for green

8=analog ground for blue
9=not connected
10=digital ground
11=not connected
12=DCC data in/out
13=hsync
14=vsync
16=DDC clock

(DDC=Display Data Channel, so Windows 95 detects PnP monitors)

Print out this mail in courier font or any other monospaced font and connect simply the st connector to the scart or VGA connector with the same function following the above listed connectors. All connectors are viewed from the solde side. On the VGA you use digital ground to the ST ground. That 2 cables (ST to Scart, ST to VGA) will do color lowres and medres resolution. Note: The most actual VGA monitors can NOT show 15kHz horizontal sync as the ST does in low and medres, the most can only show 31kHz and above, please read your monitor documentation carefully to avoid damage to your VGA monitor!!! (My NEC Multisync (the very old with manual syncing) or the Multisync 3D can do this , but not the 2A!!! There was also a VGA monitor from Acorn for the Archimedes which was capable of doing this) (Do also not make a cable VGA to Scart, that will destroy your TV set or video monitor!!!)

All STs with a "M" in their model name like 520STFM, 1040 STFM, and all STE are having a Modulator, others like 260St or 1040STF or 520ST+ do not have!!!. Simply connect the inner pin of that TV connector to the inner pin of the antenna input of a TV set, connect the outside pin of both for grounding together. For this take a kind of coax cable. On channel 36 (?) of your TV set you receive the ST desktop. But the picture will not be so good as on a scart or VGA cable.

There are lowres monochrome monitors (used for example for black and white video camera monitor), they only can show one color from low to high, some of them are showing only green to black pictures, these one can be used for the ST low and medium resolution with the following two lines coax cable:

ST connector to Cinch. (This is not the same as ST to TV antenna input!!!)
red over 270 ohm resistor to the middle pin.
green over 120 ohm resistor also to the middle pin.
blue over 820 ohm resistor also to the middle pin
csync over 47 ohm also to the middle pin
ground to the cable shield and then to the outside.
There's no audio with these monitors.

Monochrome highres resolution on a VGA connector.

link ST hsync and ST vsync to the corresponding pins of the VGA connector
link ST monochrome video over 3 x 47 ohm resistors to red, green, blue, one resistor for one color!
link ST monochrome sensor to ST ground

link ST ground to VGA digital ground.

[...]

Addendum: Pin 6 of the SCART is audio left, I have forgotten that to write... :)

[...]

Anyway, I checked out the lead used to connect my 520STFM to a Philips CM8833 colour monitor, and it's wired as follows (pin designations as per Stefan Matthaus postings in the thread 'Searching for Atari's TOO :) Atari to different types of screen'):

```
ST Function SCART (Euroconnector)
-- -------- ---------------------
1 Audio 6
6 Green 11
7 Red 15
10 Blue 7
13 Ground 17
9 + 12 H-Sync/V-Sync 20
```

Note that the horizontal and vertical sync pins from the ST are connected to pin 20 of the SCART connector via 470 ohm resistors (one in each line, not both connected together through one resistor). According to the Philips monitor manual SCART pin 20 (normally composite video in) is also used for the syncronisation signal of a linear RGB input.

If you make up a lead, it may be worth connecting the audio out from the ST (pin 1) to both left (pin 6) and right (pin 2) audio inputs on the SCART connector, otherwise you'll only get sound out of one speaker if you have a stereo monitor or TV.

Regarding the connector to fit the ST video output, it's a 13-pin DIN plug.

Hmmm, I looked there bout could not locate anyting that seemed to be
a patch like this. Can you perhaps recollect the name of the patch or
some alternate location?

Regards;

P.S.

>The files on my web site are always kept up-to-date in the light of problems
>found as they are used.
>I recommend using them over the ones from ASH.

I noticed that some texts in RSC of Magxdesk has slipped untranslated-
(something in Preferences, IIRC). When looking into the RSC with Interface
those texts have to be unhidden to be seen.

Regards again;

From the tone of your message I assume that you did -NOT- have an auto/acc
conflict. Neither do I. A simple substitution of magic.ram v6.20 with old
v6.10 cures the problem.

And any attempt to sety the time by any utility I could think of resulted
in magnificent crashes either of the utility or of the magic itself.

While waiting for a 2.5" harddisk for my atari 1040ste I have connected
a 3.5" harddisk and formatted it on the atari.

On my PC I have lots of downloaded material that I would like to move
to the atari harddisk.

Is it possible for my pc to read/write this format?

Or do I have to use floppies or serial transfer?

Regards,

Bent

By emailing me. ;-)

MiNT is supposed to work fine with fVDI/Eclipse. I don't use it that
way much myself (since I have no debugger that works under MiNT), but
I have tested it, even with memory protection, on my AB040 Falcon.

What do you mean by screen corruption, by the way?
The only problem I've seen that I'd call 'corruption' would be what you
get if you try to use the normal 4 Mbyte RageII card with the setup
for the 2 Mbyte one I had at the beginning.
The only way to get that is to start fVDI/RageII without the PCI BIOS
running, and without a '4mb' switch on the driver configuration line.

So, make sure you have the PCI BIOS up and running.

I'd suggest keeping any further communication regarding this to email.

Linux on the PC can access Atari compatible partitions. An alternative
is to partition the harddisk PC compatible and use MagiC or MiNT on the
Atari or to create a partition that is both Atari and PC compatible
using the tools included in the HDDRIVER distribution
(http://www.seimet.de/hddriver_english.html). In the latter case the
Atari and the PC can access the drive under Windows and TOS, resp.,
without any additional software.

This can happen if you run fVDI before MiNT. I'm using (or used - it's now almost a year since I last powered up my Falcon...) fVDI and MiNT on my Falcon and there are no problems as long as fvdi is started after MiNT.

I'm considering selling my Falcon, as I don't use it anymore since I got
my Milan060:

- Afterburner w. 32Mb fastram.
- Eclipse graphics card.
- Genius ethernet-card and ROM-port-adapter.

I can also sell it in bits and pieces. In fact, that would be easier as I
don't have the original case anymore...

I also have a Falcon Nova graphics cards and various other bits for the
Falcon and other Ataris. Send me a mail for more information.

I have the same 1040STe which I love. Just format a disk on the STe and put
it in the PC. The PC should be able to read it fine. Any Atari computer with
a TOS greater than 1.4, puts a PC-boot sector on a floppy when it is
formatted.

Hi Ed,
Regarding saving long file names with CAB (in case the info is needed):
..this is on C-LAB Falcon, single TOS 4.04 and standard file selector.
In the file name field of the file selector which sometimes shows
blank, the "Backspace" key will shorten the invisible file name so it
can be saved. Clearing the field with ESC or the Back key does'nt work
(here).

Body handling: HTML body converted to readable text

Starlord,

Your website is viewable by my Falcon with CAB 2.7 (though the graphics slow things down a bit). One thing I'd correct is your use of
.

You use:
Your text here

This is fine if your screen resolution matches mine, but under certain fonts in 640x480 a word or two in each line becomes its own line.

I'd use Your text here.

Note however that I use HTML 3.2 and am not familiar with CSS. It could be that you are correct and CAB is wrong.

Actually a list of drives that do *not* work makes more sense. There is no reason why modern IDE drives should not work, so a list that would have to list any IDE drive does not make much sense. Otherwise some users will think that only the drives in such a list can be used. Actually my experience is that even those drives that are said not to work usually do work. Bad cables, or with SCSI wrong termination, are almost always the reason for a drive not working.

Put it this way, all Auto/App's are tried, tested and trusted, there is no
crap on my system, so if there is a conflict then IMO 6.2 is the cause, as
going back to a min-spec setup with only 'official' TSR's also gives problems.

Atari and Caramel Corn:
Something good from the '80s

At least a decade ago, a small company wrote and released a program that would eventually evolve into a popular desktop publishing package for the Atari ST platform. Originally released as Publishing Partner, the program later became known as PageStream.

The original program, or one of its early updates, included some sample documents which demonstrated the program's uses and features. One of those sample documents was a recipe for caramel corn (!) which was not only a supremely tasty treat, it was exceptionally easy to make (no thermometer! no dropping glops of sugary goo into water!) and it was "goof proof". I no longer have the program or the original document file, but to this day I still make the caramel corn treat every year at Christmas.

So that no one need go another Christmas season without this neato treat, I am posting it here for your pleasure.

Enjoy!

Atari Caramel Corn

Utensils:

Large saucepan, cup and spoon measures, long-handled wooden spoon, 2 cookie sheets or cake pans with at least 1" sides, paper grocery bag.

Ingredients:

6 quarts popcorn (1 cup unpopped corn)
1 cup butter
2 cups firmly packed light brown sugar
1/2 cup light corn syrup
1 teaspoon salt
1/2 teaspoon baking soda
1 teaspoon vanilla
spray cooking oil

Pop corn in advance, using as little oil as possible. If you have an air-popper, so much the better. Set aside.

In a large saucepan, stir in brown sugar, corn syrup, salt and butter. Bring to a good rolling boil, stirring constantly. Reduce heat to medium and continue boiling without stirring for 5 minutes.

While mixture is boiling, lightly treat the inside of a paper grocery bag with spray oil. Place popped corn in bag. Treat the two cooking sheets lightly with spray oil.

Remove candy mixture from heat, stir in baking soda and vanilla. (CAUTION: adding vanilla will likely cause some splattering, be very careful!) Make sure the mixture is completely stirred as the soda tends to avoid the lower edges of the pan. Pour mixture over popped corn and mix gently with a wooden spoon.

Roll the top of the paper bag and place in microwave oven, preferably on a microwave-safe surface, NOT on metal rack. Nuke for two minutes, and then stir the popcorn again. (WATCH FOR STEAM WHEN YOU OPEN BAG!) Repeat this procedure twice more, nuking for 1-minute intervals until corn is completely coated. Variant: you may add some redskin peanuts during the last stir, but DO NOT microwave peanuts as they can add an unsavory smokey flavor to the corn.

Pour candied corn equally onto cooking sheets. As the corn cools, continue to stir to prevent clumping. Variant: I've never done this, but you could probably form corn into popcorn balls.

That's it! You've just made yourself a batch of Atari Caramel Corn!

The original Publishing Partner recipe called for using a warm oven instead of a microwave to keep candy hot for stirring/coating the popcorn. It was convoluted and took approximately an hour. The microwave is much faster and easier and makes no noticeable difference in the final product. (You'd have to be a Windoze user to ruin this treat!)

This recipe is certified Y2K compliant!

Hi Ed,

Thanks for the answer.

>I used emailer, but could it be that it is not
>setup correctly to use the
>Modem2 port?

What do oyu mean? Is there any option in Emailer
i have to change? I did it in Iconnect but
somehow it does not work....

> When you try to get the
>user group messages under Modem2, what happens?

Nothing..Under modem1 no problem.

Hello John,

I use Boxkite with Cab on the Hades and it does a good job of saving long file names. It also allows me to save in regular length if I so choose.

Hello all,

I am making the switch from Newsie to Okami. Newsie functions well, but since I made the switch from a dial-up ISP to a cable modem, it crashes more than it used to (ie using Newsie as my external viewer gives me a bus error). I plan to use Newswatch and Okami together. Newswatch will download the groups/messages and Okami will read them and get posts ready for Newswatch to send them.

I need to talk to someone (or some people) in the setting up of Okami. I have most of the setup done, but there are some things that I need clarification on (password file, sig file, compress program, decompress programs etc)

I have the latest version (3.0b-10). If anyone has some setup tips, I am all ears here or you can email me. Thanks....

1559. Downloading Porthos with Cab

Newsgroup: comp.sys.atari.st
Date: 2002-08-11 14:21:46 UTC
From: edbaizjr@attbi.com
Message-ID: <_pu59.64341$7n5.10270@sccrnsc01>
Source record: 32867

Hello all,

I have been using Porthos for some time and even registered. I have always been able to download it even after I got my cable modem connection. However a few days ago, I saw that there was a new version (2.05) and clicked on the "download" button. The file is about 1.2 Meg. Things started in the usual fashion until I had gotten about 129k, then Cab stopped the download and acted like it was done and my file selector came up to allow me to save the file. The real funny thing is that the file name that was in my file selector was not the name of the Porthos file, but the name of the web page I was at.

I am thinking something was done on Ivers's end, but they say things are fine. I get the same thing every time. Now, when I use the MagicNet Cab ovl file, the downloading goes almost to the end, then stops. Has anyone else experienced this? I have not tried downloading the file under MintNet, but I am going to and see just what happens.

I'm not that desperate, if I won't be able to make it myself, I won't
also order the cable from New Zeland... I think the shipping costs would
be so big that buying an original SM124 here would be cheaper ;-))

Thanks for the receipt. I will use it. I remember Publishing Partner. I have an old demo for it. PageStream resides on my STe hard drive. I used it for putting together my wedding invitations and a hyperal form used at the hospital I work at. For 4 years people were using this doc not knowing that is all done on an ST.

Well I tried it out under MintNet and got mixed results. Using the regular Cab.ovl file I got the same result. If I used the Mintnet ovl, I was able to get the whole file, but still had to change the name before I saved it. I was wrong about the name of the file coming up being the name of the web page I was at. Actually it is like this. The name of the webpage is porthos.php. The address where the file was coming from is dl.php?File=PorthosD.zip. The filename that comes up for me is dl.php.

This all led me to believe it was the ovl file, so I tried an older version of Dan Ackerman's ovl (1.3101) and I was able to get the whole file, but still had to change the filename. Invers can say what they want, but they changed something. In the end I was able to get the file and that is what really counts.

Joking about someone having a stroke is *NOT* funny... well, maybe to a
mental incompetant, like you, but not the rest of normal society.

Oh, Stevie Sweetcheeks...

I warned you in Email, if you responded in any derogatory fashion (here or
in Email), you wouldn't see the last of me... you and the rest were going so
well, too. I was just about ready to give up and unsubscribe from this
newsgroup. But you just COULDN'T keep your big blab mouth shut, could you?
Guess you actually WANT me here, to give your pathetic life some meaning...

I was also beginning to wonder where you went. You weren't here for a few
days. Guess my (and your) luck ran out, eh? You came back and, while you
were doing so well for a few days, you just HAD to slip up, didn't you.

Now I'm gonna have to hang around another week or two just so see if I can
be bored enough to leave... *sigh*

Hi Robert!

You can also add:

IBM-DTTA-350640 T54I Direct Access

This is a 6.4 GB 3.5" IDE which fits inside the Falcon housing
(just!). I wrapped it in thin card and laid it on the shielding
to the left of the floppy. Tight squeeze, but has been working for
over a year with MagiC.

I just tried, and could download the complete archive with no problem.
Maybe some problems on the line when you tried ?
Concerning the name of the archive, just rename it as Porthos.zip as
you get the file selector.

Enjoy!

I guess you downloaded it with the background module cabdload (right
click). This module uses the name of the link and cuts the name just
before the '?', instead of using the name returned by the php script.
I've already seen this on some other sites. You'll not have this problem
if you retrieve the file "normaly" with a left clik on the link.

Bye,
/Pascal/

I have to withdraw all my previous mails
concerning the functioning of my last 'purchase':
the SLM804. One of the parts was not fitted well
and that caused the papertransportationproblem.
It is amazing to see how the machine works. Only
the toner is geting weak but I have some new
ones...Further seems it that everything works
well accept for the noise...If you're used to
current technology imagine what it would have ben
like in those days in a office....

But nonetheless: old Atari's never die....

1579. FT/ Trade, Looking for Atari systems to trade (0/1)

Newsgroup: comp.sys.atari.st
Date: 2002-08-12 01:58:19 UTC
From: Someone's Fortune <NoNeed@forSpam.com>
Message-ID: <fv4eluc7ggq0kbq9fmto0rjumlhei0m29r@4ax.com>
Source record: 32886

Hi,

I have several laptops for trade. These range from Pentium II 300 to
pentium III 600. The screens
are all active matrix and they all come with cdrom and floppy, some
even have built in 56k modems.
Included is Windows98 preloaded with Eula.
I have included pictures to help for descriptions...

I am interested in a 1040ste, mega ste w/hdd, TT w/hard drive, falcon
w/hard drive for trade.
If interested in working a trade please contact me. I am located in
San Jose,CA (USA):
rdf0013@earthlink.net

Thanks,
James

the following is details for the systems I have for trade, check the
link for detailed spec on each models:

Gateway Solo 2500
PII 333
32mb ram
4gb hard drive
800x600 active matrix screen
cd rom
floppy
IR port
2 usb ports
2 pc card slots
ps/2 port for external mouse & keyboard
composite video

http://support.gateway.com/s/Mobile/Solo_Series/P2500/p250044.shtml

Gateway Solo 2550
Celeron 400
64mb ram
6gb hard drive
800x600 active matrix screen
cd rom
floppy
IR port
2 usb ports
2 pc card slots

ps/2 port for external mouse & keyboard
56k modem

http://support.gateway.com/s/Mobile/Solo_Series/P2550/p255044.shtml

Gateway Solo 5150
PII 366
64mb ram
6gb hard drive
1024x768 active matrix screen 14"
cd rom
floppy
IR port
2 usb ports
2 pc card slots
ps/2 port for external mouse & keyboard
composite video

http://support.gateway.com/s/Mobile/Solo_Series/p5150/p515050.shtml

Gateway Solo 9300
PIII 600
128mb ram
10gb hard drive
1024x768 active matrix screen 14.1"
cd rom
floppy
IR port
2 usb ports
2 pc card slots
ps/2 port for external mouse & keyboard
56k modem
digital spdif out
composite video

http://support.gateway.com/s/Mobile/Solo_Series/P9300/p930017.shtml

IDE drives require formatting software specific to those drives. Manufacturers
almost NEVER release that software (and it likely wont run on an ST anyways).
formatting utilities from ahdi and HDdriver wont work on an ide drive for sure.

Other than the fact I think you are crazy to trade a LAPTOP (expensive and all of them sufficiently powerful at that) for old, vastly less powerful, unsupported Atari computers, made by a company (Atari) that is no longer around... I'd love to locate an STe that I could trade you for that PII/300 laptop. That'd be a sweet trade indeed.

Would you be at all interested in an Amiga 1200 with 40MHz 68030 accelerator and 8Mb of FastRAM + SCSI module? Comes with mouse, joystick, 2 games, and WorkBench 3.1 (upgraded to Kickstart 3.1 ROMs also, so you can go up to AmigaOS 3.9)? I can't vouch for the complete reliabiligy of it, but it's gotta be more powerful than an STe or Mega STe. It's even faster than a TT/030 (33MHz) and a Falcon030, but... doesn't have a DSP.

Good luck.

Jared

HEY, There's a 1040STe 4Mb on eBay (with only 20 hours to go) for about $60!
Surely it won't go up that much more in 20 hours...

Jared

Dude,
ever hear the saying "Beauty is in the eye of the beholder"
Did you ever stop to think that maybe you thought a girl was hot, and
a friend didnt agree.Well it's the same damn thing with computers.
There's MAC people there's Amiga freaks and there is Atari lovers.
Why do you troll in this newsgroup with this Us and Them 1986 Bull.
I am a Cisco engineer and work with Lan crap and Wan's all friggin day
long. I get free PC's and throw em away almost every week. They are a
dime a dozen, worth nothing and have no character. And I was the
president of my Commodore club when the Amiga was released and I still
love my Atari's. I have a A4000 040 Video Toaster with TBC and
Lightwave. I use the Amiga for NTSC output and special effects.
I use my Atari for Midi and SMPTE encoding and I don't have a
problem with it. Maybe you just have some kind of jealousy cause you
didn't get an Atari when you were a kid.

i think i know what you mean,

What you describe will happen if you've not installed the manual feed platform in correctly, or it missing all together. There should be a 2.5" aprox. ledge at the meeting point between the top and bottom of the machine at the front where manual feeding is done. if this is not present you will not be able to feed from the cassette as this forms the semi circular paper path required for the paper to travel to the printing area.

Finding one of these may proove impossible if you havent got it.....

you should still be able to manualy feed 1 peice at a time however where the ledge is supposed to be...

hth

Hi Charles,

Thanks for the info, I was starting to suspect that filtering the usenet postings wasn't possible. Hopefully there will be some possibility to do that in the future. This forum is really messed up these days.

Regards,

Joakim

Boxkite does work on a Falcon, and seems to be rather solid.
However it does seem to be a tad slower than other
file selectors I tried. But afaik it is the only one
still being updated these days.

Afraid not. It could be that the patch has been incorporated into the update
file, so it's possible that you need to download and run it again. Can't be
of any more help I'm afraid :-(

I concur, Cubeat don't run in my Falcon either, same 'no key, goodbye'

I have Cubase v3 and Cubase Audio in stock, a lot cheaper than the 'bargain'
from Steinberguk.

Mark,

>The whole point was that I asked him to show me something tangible.

That *was* not the point, I asked you to stop writing nonsense about MagiC, it's crystal clear to me that you know nothing about the development. You have managed to pronounce it dead twice in less then a month, if you had the slightest clue about what was really happening and would have tried to comment on it in an objective manner you wouldn't have heard me.. I suppose you're the type that doesn't like being corrected, well, there's a very simple solution, stop writing about stuff you know nothing about and you wont get egg on your face :-/

>And so far I still do not have anything tangible, leading me to assume that
>I'm right and he's wrong.

Like a lot of people here, I don't really feel the need to start bragging about *all* I do/did for this platform. Over the years I've learned that people who make a lot of noise bragging about how valuable they are for this platform nine out of ten times are like a hot air balloon... I've seen a lot of guys like you coming *and* leaving here.
Let's talk in five years from now, I'll be still here, will you?

>what makes this situation so much more difficult to stomach is that nothing
>tangible has been done. So in this instance it's one of those answers to
>the question "Defend your existence", and I think he might have a difficult
>time doing as such.

So I have to defend my existence in CSAST to someone who's still wet behind his ears? First of all, this is a PUBLIC forum, one doesn't need to defend his presence here at all.

Since you are probably going to keep on whining about what I do/did for this community and just to show *you* that I don't need other people standing up for me in here I'll humour you.... but remember, this is the first time and the very last time I'll do anything like this again. If everyone here that doesn't agree with you has to post his resumee only to justify that he is dedicated to this platform....

When you weren't born yet, I bought an Atari 800. In Belgium Atari wasn't present, no shops, no magazines, no nothing... In february 1981 I got in touch with Atari Holland and started the first Belgian Atari usergroup, it

was located in a place called Mechelen and in 1983 we had over 300 paying members and some 2000 members that never visited the meetings which for a small country like Belgium was remarkable. I've started a Public Domain library which was unique in that time, unlike all the others we sold software for exactly the cost of the disk. I've started bombarding the agency that spreads foreign magazines with letters demanding that they would also sell Atari magazines, after a mountain of letters they gave in, and AFAIK Belgium was the only European country where one could buy French, Dutch, German, British and American magazines in *every* papershop around the country.
The next thing I did was to hassle the big warehouse chains, demanding that they started to sell Atari computers... it took another mountain of letters but in 1983 I convinced the "Grand Bazar" chain to stock up and sell Atari. Six months later the "Fnac" stores gave in as well, and from then on Atari was present and for sale in Belgium. The "Grand Bazar" stores enclosed a flier about the advantages of joining our usergroup and a free one year membership, so I have a pretty good idea how many computers they sold...
In the mean time I also started a newsletter, which contained 36 pages full info.... have you ever tried to write something similar all on your own and get it out on time every two months? Don't you tell me anything about writing articles and publishing magazines (read on...)

In december 1984 Atari showed the 520ST to the public for the very first time on the American CES computer show and I knew instantly that it would be an enormous hit, so once again I charged my batteries and started to hassle all major computer shops in Belgium largest towns, and it worked....
In may 1985 the 260ST was shipped to Belgium and available in the at those times, most well known computer shops. I remember visiting Britain in june 1985 and there wasn't one single 520ST for sale there... Have you any idea how good it felt to saw Atari's all over the place standing next to crappy PC's and Macintosh rubbish? I really got a kick from it... If any Amiga fan is reading this; the Amiga 1000 was still on the design table in those days, the 520ST was the most advanced computer available in 1985 and as far as value for money goes nothing even came close.

In december 1985 I managed to convince Atari Holland that because of Belgium it's unique situation we really needed a seperate devision, Belgium is a bi-langual country, the northern part speaks Flemish, the southern part speaks French. People living in the southern part wanted a Atari with French TOS and azerty keyboard, while people living in the north preferred an English TOS with qwerty keyboard. In january 1986 Atari Belgium was founded with the special blessings of Jack Tramiel, who I've also hassled with a mountain of mails.

In the meanwhile nearly all the Atari 8bit users upgraded their machines to the ST, and early in 1986 we decided to closedown the 8bit usergroup, which is something that I still regret today.... anyway, ST-usergroups were popping up all over the country and Atari computers were selling like hotcakes. So being married in the meantime and having other priorities in life I thought that my mission to get Atari into the Belgian houses was finished. I joined a usergroup in my hometown and decided to start living a normal life... the life of an average Atari user....

Well, that was a capital mistake, the phone kept ringing constantly, user groups asking me if I could possibly come to demonstrate a new application. Atari dealers who experienced problems getting stuff from Atari, editors from Dutch magazines asking for an article about a new application... etc. Instead of getting a life, it got worser all the time.

Atari Belgium asked if I would like to show off the new MegaST and laser printer on the national TV station, and before I knew what happened I signed a deal with the AVRO (a Dutch nationwide TV station), to take part in a 24 weekly broadcast computer program. I've had to proof live on air that Atari *could* be used by professionals... I've showed how easy it was to produce DTP work, presented TechnoBox Cad, word processors, databases, spreadsheets, PCB design... etc you name it, and we could do it on our Atari. To put a little entertainment in the show there were some idiots trying to create the same stuff on a PC and a Mac.... at the end of the show they compared the results, in those 24 shows I only lost twice, not because it couldn't be done on Atari but simply because I didn't know the programs well enough (Steinberg Pro24 and TechnoBox). The show was viewed by more then a million people, and I'm convinced that I persuaded lots of people to choose for an Atari instead of going the PC or Apple route... the network received roughly 1000 letters each show from viewers asking for more info about Atari, although they payed the stamps, there was no way I could possibly reply to all these letters, but Atari Belgium and Holland did....

Just like I don't always agree with the opinions of certain individuals here in CSAST <grin>, it didn't took long before my views on how a usergroup has to function conflicted, so I started a revolution and took over the local Atari usergroup... using the motto "never change a successfull formula" the very first thing I did was to publish a Atari ST club-magazine, using Calamus 1.05 and the Atari laserprinter, I published it six times a year, and because there were no volunteers wrote the whole thing myself. Whenever there was an important computer show in Belgium or Holland, I made sure our usergroup was present, printed 1000 copies of the roughly 56 pages magazine and spread them free among the visitors...
In Holland there used to be 3 dedicated Atari magazines for which I regularly wrote articles, whenever Atari released new hardware the general computer magazines asked me to write a review... and I always made sure that these reviews were sleazy adds simply by comparing Atari with the competition :-)

Germany was Atari-country in those days and the best apps originated from their (no offence), I noticed that a lot of users had big difficulties understanding the apps, not to mention the manuals which in those days were massive, so in the little free time I had left, I started to translate the major apps in Dutch/Flemish. Atari used to pack English and French manuals with the computers, anyone in Holland and Belgium having a Dutch/Flemish manual for the TT, Falcon, Portfolio, Lynx 1 & 2 and the Jaguar has a piece of my work in his hands....

Other stuff that I did in those days was to get the Flemish users to the German Atari shows, every time there was a show in Germany I chartered bus-coaches and for a very modest sum people could go and see for themselves what

was happening in Germany.... can you imagine a Atari computer show attented by 35000 people? to get high I didn't need to smoke pot, attending a German Atari messe got me going for weeks on end....

Together with Atari Belgium I've also started up a service that hired Atari gear, someone wanting to use a laser printer or TT could hire it for a week or more, we charged very little, just enough to cover the cost. Once that we got it running succesfully, ISTARI took it over. (Belgian Atari users will know what ISTARI was...)

In the late eighties, Apple became a serious contender having more powerfull computers and software that exploited it. Focus was moving away from Atari, so once again I recharged my batteries and started to hassle the Belgian education department, together with a representative of Atari Germany we closed a deal that introduced 3000 complete MegaST4/laserprinter combinations into Belgian schools. In those days most of the teachers didn't have a clue about what a computer was, so with the help of Atari Belgium we organised seminars where I introduced the teachers to "working with an Atari".

It was a wonderfull time back then, and Atari was taken more seriously all the time, in the early 90's there were 45 offical Atari dealers in Belgium and roughly 100 computershops selling them in addition to PC's and Mac. And then it started to crumble.... increasingly more people, firms and schools turned away from the platform and opted for a PC, the mainstream user didn't really notice it at once, Atari was present in every highstreet giving the false impression that things never were any better, but Atari Belgium for the very first time lost money... they hardly sold any TT systems, the STE's were very low priced to be competitive against the Amiga 500, which especially among the "gamers" was preferred over the STE. The MegaSTE didn't sold very well either, people owning a MegaST had no incentive to upgrade, the double speed was not an argument...
At usergroups I increasingly heard more complaints from "serious" users about the hardware not being competitive enough with the new Macs and the PC which got increaslingly more popular... instead of releasing what people asked for Atari gave us the Atari PC, it didn't do very well...

Then came 1992, rumours about a new "super" computer that would blow away the competition didn't stop, I knew a lot of people back then who were thinking of bying a TT put waited for the new one... when I saw the Falcon in august 1992 at the Atari messe in Dusseldorf, for the very first time I felt dissapointed in Atari.... I didn't like the Falcon from the very start, and I still don't. What I expected was a machine with at least a 68040/25Mhzm and a ISA based graphic card, instead of releasing a more powerfull computer then the TT so that at least they could keep the very profitable business users happy, they managed to release a disguised toy!! The casing of the 1040ST didn't go down well either...
Atari Belgium asked me if I would like to participate in promoting it, and I refused, there was nothing available at that time that could show off it's capabilities, programs like Chagall, True paint etc... which were written specificly for the Falcon ran much better on a TT anyway... Atari started the biggest and most expensive promotion ever here in Belgium, with a truck and a

bus they toured through Belgium for about six months, in every major town they tried to show off the Falcon, but the damn thing wasn't even for sale... One year after being shown at the messe, it was still in short supply, and it most certainly wasn't because it was selling like hot cakes... I've lost count of how many people I knew back then that migrated to a PC or Mac... :-(

Since Atari used to give me a VIP card, I had entrance to the closed part of the Atari shows, and that's how I got in touch with some German programmers or managers from softwarehouses, when discussing new releases and asking them why on earth there wasn't at least an English version of their apps available most of the time the answer was always the same: not enough money to pay for a professional translation service and/or not knowing English well enough....
In 1992 I translated PhotoDisc PCD for the German softwarehouse Trade it, and 10 years later on I'm still keeping myself busy translating software and the occasional manual.
I don't really recall everything I ever translated, in 1996 I had a hard disk crashing on me and lost almost everything (I *used* to be the type that didn't think that backups were necessary), but here's a incomplete list anyway:

Some of these are the official translations, others aren't. From several apps I have made several versions.... TBH, although I did my very best, my first work wasn't very good by today standards :-/, but remembering the kind of sloppy translations in those days, I've got nothing to be ashamed about....

Three years ago Derryck Crocker and me decided to join troups and from then on the overall quality of the translations has been very high. I'm not saying that every translation is perfect, but we're both more or less perfectionists and before anything is put online, it's been tested out intensively...
Some 18 months ago Peter West joined us and from then on we are known as DDP which stands for "Derryck, Dennis, Peter", following are *some* of the apps released by D&D and DDP in no particular other:

ASH Emailer Cab (2.7 and 2.8) MagicDesk
Fiffi Teli Chatter
Jinnee IConnect RSM
RTR Wensuite 3.3c PhotoTip
NovaScan 1.26 Cypress 1.74 Papillon 3.04
Quarx Olympia Texel
UDO shell QED 5.02 PixArt 4.52
IFusion D2M Bubbles 3.0
Blyp CD Pro 3.2 Jane 2.11
Orgniser XGEM

Since you took a blow at DDP, let me tell you that the English translation and manual of Calamus is brought to you by Peter and Derryck, the long list of apps cover only a portion of what we do, there are countless apps out there which don't carry our logo but without our help would still be in glorious German or French... like I said earlier, I don't feel the need to come here bragging about what I do and neither do Derryck or Peter. But let me tell you that we're still going strong, we've got a "to do" list of at least a mile long, and personally I will not stop before every single app on that list is available in English... We've started out with supplying only the translated RSC, the next step was to make patches to get rid of the remaining German or French, and now we tackle the HYP files or docs aswell, like I said earlier, it's no big deal... but ever so often we get a mail from someone thanking us for what we do, and that's the living proof that what we do is a necessity. Knowing that I can make even one guy his day is all I need to get me going.

This is probably the longest post I've ever written, so I'll put you out of your misery and spare you the long list of apps that I've beta tested the last

15 years....

After the Falcon debacle and refusing to promote it and I disappeared more or less from the public eye, but kept the motor running in the local usergroup, a lot of my time was taken up by the translations as well, there was no internet in those days, so everything was done by snailmail, before a translation was finaly ready to be released and some bugs fixed, months could easily pass by. I've spend a small fortune on stamps in those days.... these days everything is so simple, if I encounter a problem all it takes is a mail, and a couple of hours later the reply is in my mailbox. Back then I had to wait roughly ten days for a reply...

Just one more thing: You never ever saw anything from me? has the thought ever occured to you that this is because I'm a Belgian? I find it difficult enough to write a proper article in my own native language, I know my limitations and as far as writing English articles go forget it. My English may be good enough for this newsgroup, but it certainly isn't good enough to write articles. I hate reading articles with typo's or incorrectly phrased words, there's enough crap out there, without me having to add some more to the ever growing mountain...
Only people who haven't got English as their native language will probably be able to appreciate what a task it is to translate even a simple readme.txt into glorious English, have you any idea how long I have to struggle with a German or French manual to turn it into a more or less acceptable english one? Read this post again and it should be crystal clear that my English isn't good enough, sadly... if it was you would see me all over the place :-)

So here you have it, take it or leave it. I could ramble on quite a bit longer about helping out people the last 21 years, solving problems etc... I still do it, and will continue do so so as long as it's appreciated and needed. I don't always do it here in CSAST, most of the time help can be offered quicker and more directly by personal mail...

Let's hope, you've learned something from all this... never ever judge someone in this newsgroup, you have no idea what some of the people here accomplished and did/do for this community. *EVERYONE* here except ofcourse for Jared Falvo and Sinclap is dedicated to this platform, they must be.... or they would have left it years ago, feeling better/superior because you can code is ridiculous, but part of the process of growing up I suppose.... there's still hope for you.

Cheers from Belgium
Dennis

From: Frederic Fouche <g213778@coazter.myip.org>
Date: Wed, 7 Aug 2002 19:07:45 -0500

Hi Frederic,

>so what are they complaining about when everytime there's an application
>that won't run on their machine? If they are happy running Word perfect on
>a 520ST, what's the problem?
>I don't get it.

I never said I understood these people. Perhaps it's because in the past the programmers & softwarehouses spoiled them by making sure that most of the apps ran on their machines.... it'll take a while for these users to realise that those times are (almost) finally over.

>Same thing with mint only apps. When you run magic/singletos, deal with it
>and don't complain about anything, that was their choices.

Sorry Frederic, but IMO that is not the same thing.
Not being able to run a Atari TOS program because of memory limitations or a missing 68030 and/or DSP is a complete different story. MagiC is the default OS on my system, if someone out there would release something that would only run under MiNT, and supposing I would love the program, all I have to do is use MiNT...
What these people need to do it to invest money in a new system, but before someone forks out lots of money, he'll want to know for sure that it's money well spend. The way things are going on this platform, I wouldn't advice anyone to invest $1500+ in it....

>never seen this app to be honest.
>But you make it sound like Oracle, DB2, MySQL is just overkill and useless
>when this 17y old app did the job just fine.
>Someone is wrong as you can imagine here. I won't say who though.

Timeworks database was part of a suite; there used to be WordwriterST, CalcST and DatabaseST, Timeworks ofcourse is best known for its DTP package. If I gave you the impression that DatabaseST is just as good as Oracle, MySQL etc... sorry, it isn't. I wrote that it is a *very simple program by today standards*.... it all depends what reords you want to keep. If all one does is to keep track of a couple of addresses or his disk/program collection then DatabaseST is still usefull. One can keep track of the same stuff with Oracle ofcourse, but that's overkill.

Cheers from Belgium
Dennis

Joakim,

You could use newswatch/Okami instead which has good killfile facilities for
ng.

Kid... I *WAS* Atari, growing up... from the 2600VCS (the 6-switch model...
remember that one?), to the Atari Falcon030. I probably (I say "probably",
because I may miss a model/version or two) know every model and every
version of a model. I'm just mad because the Tramiel's KILLED Atari... only
a decade after they saved it! What friggin' logic is there to that?

Jared

P.S. I'm glad you're finding use for both sides of the coin (or maybe all
three sides of the coin (if such a coin existed)). I'm mad because Atari
ISN'T around anymore. But Amiga is, hence why I am now a bitter,
anti-Atarian, semi-Amigan (I'd be a full Amigan if I could get my A1200 to
work without bonking the video!)

>>file.

I had similar occurences several times (a couple of years ago) with CAB when downloading large files: file transfer would start and then, prematurely, a file-selector would appear as if the transfer was complete, although only a portion of the file had been transfered. IIRC at that time I was using Booklage's CAB.OVL for Sting.

I noticed that those problems appeared (at that time) on some web sites only: e.g. europe-shareware and vezz's hardware-hack site, and a couple of others which I do not remember now. After a number of attempts I concluded that the problem appeared when, because of net congestion, average transfer speed dropped below, say, 80% of theoretical values. It was almost as if there was a timer somewhere which finished the transfer after some theoretical period needed to transfer the file has been exceeded. I solved the problem by taking those files at times of day when net traffic was low: i.e. very late at night. I remember I even contacted Vezz about that, and he said he was aware of the issue but that it was a problem of the provider which hosted his site (later he changed the provider, iirc).

>crap on my system, so if there is a conflict then IMO 6.2 is the cause, as
>going back to a min-spec setup with only 'official' TSR's also gives problems.

As it appears that the author of Magic was not much inclined to do something concerning this issue, I am afraid that any new versions of Magic may be unusable on machines like MegaST(e). That is a pity, because it seems from the V6.20 history file that there are important improvements relative to previous versions.

Btw. any idea why did he change the time routines anyway- what was wrong with the old ones?

Maybe it would be possible to locate the time routines in the old magic.ram and patch them into the new version...

Hei All.
I was treking around Suzy B Software#2 when I came across a program called ZeST. An alternative
to the standard desktop, mainly on the same design as NEXT in unix. True I may have small mind, but it seemed quite
interesting, especially when people were looking at mint or linux. Do anybody know what happened with it.

regards eyebrow raised.

john.

Whether you use the popup menu option or the usual left click method
doesn't matter : within the file selector, hte name is porthos.php,
which you just need to rename as porthos.zip - that's all!

Peu importe qu'on utilise l'option du menu contextuel ou qu'on clique
avec le bouton gauche sur le lien, c'est porthos.php qui apparaï¿½t
dans le sï¿½lecteur de fichiers. Il suffit alors de le renommer
porthos.zip, c'est tout.

Have fun, / amuse-toi bien,

J.-Luc

Nuff said, same here. Have PC's all over the place at home. Work/repair them all day come home and switch the Atari Falcon's on;-). They have more character than any WC compat. 99% of people that use this group love their Atari's, but some Missionaries try to convert the heathens from what they are happiest with. The truth is this is an Atari NG and we mostly don't give a shit about other platforms. The worst thing about PC users is their sheer inability to look at what they have got and work with it. An 1985 ST is fine for word processing, Games, midi sequencing, etc so leave us happy people alone to use our computers in peace......

1622. Re: FT/ Trade, Looking for Atari systems to trade (0/1)

Newsgroup: comp.sys.atari.st
Date: 2002-08-13 00:08:33 UTC
From: Mark Bedingfield <mark@computercom.nospam.com.au>
Message-ID: <56Y59.12331$Sy4.38694@news-server.bigpond.net.au>
Source record: 32828

Nuff said, same here. Have PC's all over the place at home. Work/repair them all day come home and switch the Atari Falcon's on;-). They have more character than any WC compat. 99% of people that use this group love their Atari's, but some Missionaries try to convert the heathens from what they are happiest with. The truth is this is an Atari NG and we mostly don't give a shit about other platforms. The worst thing about PC users is their sheer inability to look at what they have got and work with it. An 1985 ST is fine for word processing, Games, midi sequencing, etc so leave us happy people alone to use our computers in peace......

1626. Re: Hmmm

Newsgroup: comp.sys.atari.st
Date: 2002-08-13 00:25:28 UTC
From: AtariMad <nospam@not.telling.u.ok>
Message-ID: <umY59.44060$oo4.9230@news-binary.blueyonder.co.uk>
Source record: 32832

> It's been awhile. Whatcha up to these days?

Nothing much, Uni, work etc etc :)

Just thought I'd have a look at the newsgroups, it's been aaaaaages, and
I've not been IRCing for quite a while either.

AtariMad.
I think therefore I AM.

1627. Re: FT/ Trade, Looking for Atari systems to trade (0/1)

Newsgroup: comp.sys.atari.st

Nuff said, same here. Have PC's all over the place at home. Work/repair them all day come home and switch the Atari Falcon's on;-). They have more character than any WC compat. 99% of people that use this group love their Atari's, but some Missionaries try to convert the heathens from what they are happiest with. The truth is this is an Atari NG and we mostly don't give a shit about other platforms. The worst thing about PC users is their sheer inability to look at what they have got and work with it. An 1985 ST is fine for word processing, Games, midi sequencing, etc so leave us happy people alone to use our computers in peace......

1631. Atari web-site FAQ!!!

Newsgroup: comp.sys.atari.st
Date: 2002-08-13 02:08:38 UTC
From: carey christenson <firest@williams-net.com>
Message-ID: <1029179346-294855AEicMi@williams-net.com>
Source record: 32833

Everyone,
Here is a ***NEWLY*** updated list of everything that I have and some of what people have given me in my e-mail. Thanks to all who have sent me there favorite web-sites!!! This is meant as a good resource for people to find web-sites related to Atari computers. This list is by NO means complete and can always be added to or deleted from if found that a site is no longer operational. Please direct all comments to me at firest@williams-net.com. Please if you have any web-sites to add to this list by all means send them to me and I will add them in. If you find a web-site that NO longer works let me know and I will check it out. I will do my best to update this list at least twice a month and post in this newsgroup. If this becomes to big I will break it down into smaller messages and post each message one a day as to not overload the newsgroup!! We as Atarians must band together to help to ensure the survival of our platform!!

Thanks,
Carey Christenson

Nuff said, same here. Have PC's all over the place at home. Work/repair them all day come home and switch the Atari Falcon's on;-). They have more character than any WC compat. 99% of people that use this group love their Atari's, but some Missionaries try to convert the heathens from what they are happiest with. The truth is this is an Atari NG and we mostly don't give a shit about other platforms. The worst thing about PC users is their sheer inability to look at what they have got and work with it. An 1985 ST is fine for word processing, Games, midi sequencing, etc so leave us happy people alone to use our computers in peace......

Your gay bashing. YOu do need to read my earlier posts, I never bashed anyones sexuality, I bashed you, but then you have no
sexuality to speak of.

In short: Sinplop --> Lies --> Loser!!! (YOU!!)

> Chunks' is from your back yard, a child hood friend and current one,
> so don't deny it.
>

You dont live in my backyard so your imaginary cant live there. Judging from the neighbours complaining from you not having showered
in years, confirming that you have not left your mothers basement in years. Not surprising since you lurk on usenet for days
straight.

> mom's basement is down south, my residence is SW MPLS.. Whats with
> you and mom's basement. Is that were she keeps you and chunks plus
> your adopted off springs there? Sounds like Lurch...

YAWN. Another lie about where you live. Last time you claimed to be in Iowa, before that Idaho, before that, in your words,
"300 miles south of china" placing you firmly in the south china sea, or north korea. Considiring your idiocy, either of those
last two would be fitting places for you.

1635. Re: FT/ Trade, Looking for Atari systems to trade (0/1)

Newsgroup: comp.sys.atari.st
Date: 2002-08-13 02:49:47 UTC
From: Mark Bedingfield <mark@computercom.nospam.com.au>
Message-ID: <ft_59.13071$Sy4.40087@news-server.bigpond.net.au>
Source record: 32841

Nuff said, same here. Have PC's all over the place at home. Work/repair them all day come home and switch the Atari Falcon's on;-). They have more character than any WC compat. 99% of people that use this group love their Atari's, but some Missionaries try to convert the heathens from what they are happiest with. The truth is this is an Atari NG and we mostly don't give a shit about other platforms. The worst thing about PC users is their sheer inability to look at what they have got and work with it. An 1985 ST is fine for word processing, Games, midi sequencing, etc so leave us happy people alone to use our computers in peace......

There indeed was a problem with the clock routines which I finally
fixed. As far as I remember, I sent the corrected patch file to ASH.
Unfortunately I cannot remember exactly what problem it was, because
it is just too long ago. You could either ask in the German news group
(maus.computer.atari.software) or ask ASH.

Some weeks ago I sent an English version of MagiC 6.20 to the Behne
brothers who had asked for it and wanted to pass it to their English
distributor. Unfortunately I do not know what they really did with it
or if they are on holidays or whatever.

BTW: What was the last version that was created for the UK?
Unfortunately I cannot remember, and I did not keep all releases.

>increasingly important to some. I think a certain person is just upset
>that magic does not move forward like mint does, magic has network ability
>somewhat compatible to mint, only cause some end user created his own mint
>like hack.

Like many people the "robust networking capabilities" is something I don't use, I have absolutely no need to put my computers in a network, I wouldn't know why and I can't think of any advantage either to start with... as for internet with a high speed connection, as long as we haven't got a browser that is up to the job, I don't really see much advantage of hooking an Atari on it. So, at the moment a multitasking OS with network capabilities is something I have no use for, meaning that one of the biggest arguments in favour for using MiNT passes me by...

>The company behind magic apparently does not see that as important at all,
>or they would have addressed that issue themselves.

There is no company behind MagiC, only a distributor. I assume you know the difference between a distributor and a softwarehouse? And yes, just like you I think that the programmer doesn't find it important at all. Atari never produced computers which were capable of addressing networks, even the clones don't come standard with it. Until recently adding a network card wasn't really easy either, only for the TT and MegaSTE a solution was available. So, yes MiNT has networking capabilities, but for years people using i.e. a Falcon or ST couldn't use it. It's like implementing support for USB 2.0 in HD Driver, nice to know it's there, but of no use....
Don't hold your breath, but I'm pretty sure that the new version of MagiC will have "robust networking capabilities" and like usual it will be solved in a much more elegant way, and easy to set up for the users.

>As Dan pointed out this has nothing to do with the original topic, but
>I won't sit back and listen to such silly comments.

I'm in your killfile, all you see are bits and pieces of quoted text, some are even out of context, don't you come here telling me what is on and off topic, follow the thread back right from the start, and you'll see that I'm right on topic.

Cheers from Belgium
Dennis

From: Frederic Fouche <g213778@coazter.myip.org>
Date: Wed, 7 Aug 2002 19:14:26 -0500

Hi Frederic,

>Big hack for example is the excellent program called "Le Redacteur",
>awesome program, VERY VERY picky about what TOS version (single, official
>from atari).

Hey that brings back sweet memories :-)

I have Redacteur 3.0 but never upgraded it to 4.0, it had a for that time very advanced spelling checker, and for people writing in French is was simply the best available... IIRC it could even check the grammar and suggest better alternatives?
I don't know about version 4.0, but 3.0 ran fine on TOS 1.04, 1.06, 2.06 and 3.06. On MagiC it runs in single task mode only which is an indication that it's not very compatible...
Is it possible that it runs only on French TOS'ses correctly? Early versions of Signum2 had a similar problem...

>What do you say to that "hack"? There are many more programs like that.
>It is just a matter of trying your prog under different configuration, and
>have good beta testers.

Look, I know that there are tons of software having difficulties running under all the OS's and their various versions. But I was commenting on Calamus, Word Perfect etc... which happen to work on every single version of TOS and MagiC. How could a betatester back in 1989 test if a beta behaved correctly under MINT or MagiC? I'm not really convinced about the tale of following the Atari guide lines either, Atari released MiNT in 1993, I doubt that the guidelines given in 1989 were still representative.
IIRC Atari officially stopped supporting the ST and STM in june 1992, I think that the guidelines from then on included how the apps had to behave under a multitasking environment. Someone coding in 1988 or 1989 following Atari their guidelines still had to release an update, if only to prevent the application garbling away all the available memory.
Remember how many apps didn't ran when the TT was released? The guidelines AFAIK didn't mention anything about how and with what to compile a program...

>Half of the program don't work on XP when they worked perfectly fine in
>w98.
>Is win98 a better OS because it ran more things?

Are you asking me to comment on a PC? Of all people why me ? LOL...

As far as I'm concerned the hardware is a dirty hack, the OS is crap and people using it out of their own free will are idiots. I do however make the distinction between the idiots using these because they feel a PC is "great" and the poor souls who have to sit behind these 8Hrs a day to make a living .... their boss is an idiot.

Cheers from Belgium

Hi Adam,

>Even if a program runs on all TOS versions it doesn't mean that it is good
>written program. Multitasking enviroment is much more complicated and you
>have to stick to specifications more closely than in singletasking. Hack is
>hack, even if works.

True...
But from a users viewpoint this means nothing. All the user is interested in
is that the application runs and behaves like should be expected. No matter
how many hacks the programmer implemented, personally I couldn't care less
if a certain app is a hack... al that matters in the end is that it works
for me.

>I think that it is not hard to write a program that will run clearly on all
>AES versions we have. Most programs do. That means: programs that doesn't
>need fixing. Yes, there may be bugs in N.AES, it isn't perfect (what is?).
>But I've never seen a bug that would make programer drop funcitionality.
>Just try harder, don't be lazy.

I probably know the wrong type of programmers, but the ones I know are the
lazy type... ;-) Just like some people who port Linux stuff don't want to
spend any time making an elementary GEM interface, there are programmers
out there that don't want to spend time making sure that their app works
under MINT/N.AES.

Hi Djorde,

>Hmmm, I looked there bout could not locate anyting that seemed to be
>a patch like this. Can you perhaps recollect the name of the patch or
>some alternate location?

AFAIK this patch is not online, ASH doesn't update the pages very often,
get in touch with Oliver Buchman from ASH and he'll mail it over, at the
moment however ASH is closed (holidays) until the 19th august.
But don't expect too much, I've read conflicting reports about that patch
in the German newsgroups. It seems to work only for some...

>I noticed that some texts in RSC of Magxdesk has slipped untranslated-
>(something in Preferences, IIRC). When looking into the RSC with
>Interface those texts have to be unhidden to be seen.

You are absolutely right :-(
We'll fix it as soon as possible.... thanks for reporting it.

Cheers from Belgium

Date: Wed, 7 Aug 2002 10:04:08 +0200

Hi Pierre,

>The program is in development but now functionnal (as all the releases on my
>website). Still in French language, but I will translate into English soon.

If you need any help or encounter some problems while translating the app
and manual get in touch with me, DDP will take care of it.... while we take
care of the translation, you can focus on coding...

Cheers from Belgium
Dennis

>I wasn't involving DDP. I simply mentioned that you host for them. DDP
>does great things, but I can't help but to observe that most of my software
>is hand translated by myself.

I host nothing.... in fact I don't even have a website.

>As for the weblinks section of my site, it is user contributed. I am not
>sure if you are referring to DHS or what, god only knows.

As the host you have the moral (and probably legal) obligation to check out
these links...

>As far as the Nova card? Hell, I was exploring ideas. Firstly, it is well
>within my rights to reverse engineer my Nova card if I want to. And if I
>do as such and produce my own second Nova for use in my Mega STe or
>something, oh well, it's my legal problem. Fact is my roomate spent a
>quite rediculous sum of cash to purchase that thing which is more then I
>can say for others.

That's not exactly the same thing is it, I've got some of your posts here in
which you sing a complete different song... you've changed your tune after
some people pointed out to you that what you were about to do was illegal.

I've payed a by today standards ridiculous sum for my Nova card also, but
it's worth remembering that ATI MACH 32 and 64 cards were considered to be
top of the line cards in those days.... browse through any PC-mag from the
period 1993-1997, you wont find any under $280. Add the interface, drivers
and impeccable service one received and the Nova Cards are a bargain...
Oh, and although I didn't respond to it at the time: the NOVA drivers are
NOT free. The upgrades are free, but until late 1998 could only be obtained
from the German based ComputerInsel BBS, only registered owners of a NOVA
card had entrance. I took me months to convince Gerhard Huber that for people
living outside Germany getting access was quite diffiicult and very expensive.
After hassling him for weeks about it he finally agreed, and ever since anyone
can load the upgrades 2.67 for the MACH 32 and 64 cards from the DDP website.
People that use a ET4000 are out of luck... and the same applies for the NOVA
Mustek and HP scanner driver...

>The only remotely immoral thing I have ever even mentioned anywhere on my
>site I believe is my article about Aranym telling people how to find a TOS
>4.04 rom. If you have some sort of problem with that, you can stick it up
>your ass. What's Infogrames done for us lately, besides doesn't Milan own
>all the rights to TOS now? What's their take on older version roms being
>distributed.

No, I wasn't referring to that, I haven't visited your website for quite some time now... believe it or not, but I appreciate the time and effort you put in the website.
But I see that we need to refresh your memory a little:
You're the one who has no problems in stealing CAB, you justified this by saying that because it wasn't developed any further you didn't feel obliged to pay for it... you're also the one that adviced *everyone* to just steal commercial software on the basis that it's to difficult to obtain for someone living in the states and that open source is better anyway. You're also the one who thought that a betatester should be payed for his work...
That particular post started a very long controversial thread, you were very wise not to participate in it...

These are the bits I was referring to when mentioning your morals. You have *never* retracted one single line of the rubbish you wrote, which leads me to assume that you still stand behind *everything* you wrote.

>I don't brag. I inform people. I try to relate to people. Obviously I'm
>misunderstood.

OK... bragging wasn't the correct word. But yes, IMO you have problems as far as relating to people is concerned.

>I inform people.

That's what instigated my post. If you take it upon you to inform people then you have the obligation to check out every bit of news you spread. And stating that development of MagiC is dead was mis-information....

>Uhmm, well yeah. That's the root issue I believe. The fact that I can have
>my opinions and views, and you can have yours. But hey, I'm not the little
>horse who came in here spouting off a bunch of piss-poor attitude shit in
>everyone's general direction. The point of a newsgroup is is to have
>multiple opinions. Therefore if I happen to not like MagiC much and don't
>give him a link and you feel he should have one, you can just tell him your
>point of view instead of continuing yet again to take personal offense as
>though you yourself are an ASH employee. What is your problem *anyway*?

I haven't got a problem.... but just like a MiNT user doesn't like to read crap and bullshit about his favourite OS, neither do I about MagiC. We've had OS wars here for a lot less... It's not about giving a link or not, the whole content of the post was biased, someone who claims to write "informative" articles should know better. The last five years I have seen many posts from people proclaiming MagiC as being dead, there's a big difference between wishfull thinking and reality...
This month it's exactly one year ago MagiC 6.20 was released, when was the latest *official* MiNT upgrade? IIRC it's from september... Should I proclaim MiNT dead because nothing happened to it since a long time? I think not...
ASH just like all the other commercial programmers/softwarehouse/distributors doesn't make announcements about what is going to come or future releases, for some reason (it can't be competition) they like to keep it a secret and surprise their users....

>Heh, take it or leave it, that is the truth that a lot of people are stuck
>on 4 meg ST's, which may or may not have their place here and there. But
>it could be argued that people like you and the other 85% of the people out
>there who refuse to upgrade past a machine made in the late 80's are what
>killed Atari to begin with. Maybe at least their computer division. How's
>it feel to be a murderer.

Are you calling me a murderer?
I bought a 520 ST in 1985, a MegaST in 1987, a TT in 1991 and a MegaSTE in
1992, the only computer I never bought was the Falcon, when you have a TT the
Falcon just wasn't good enough, if Atari would have released a Falcon II like
many people expected in 1995 instead of a games console, I probably would
have been one of the first people to own one. I've supported Atari from day
one until the very sad end.
BTW: nobody killed them, they commited suicide... any business that turns a
blind eye to the demands of its customers will eventually go down. Atari
ignored what their most valuable asset, the customers, wanted...

>Now what's all this talk about morals? Devoted Atarians who are unwilling
>to put their money where their mouths are.

I could write a long story about programmers who kept releasing ST-compatible
software long after Atari officially stopped all support for these computers,
but that's all water under the bridge. But tell me.... how does it feel to
use hardware from murderers? considering your age you possibly couldn't have
bought anything you own now brand new... what's worser? being a murderer or
stealing and consuming from the graves?

>What's Infogrames done for us lately, besides doesn't Milan own all the rights
>to TOS now? What's their take on older version roms being distributed.

AFAIK Milan has the rights to distribute, sell and adapt one specific version of
TOS *with* their MIlan computers, they do not hold the rights on TOS itself. That
said I have no idea who or what is the legal owner of TOS right now. Logicly it
should be Infogrames, but since Atari was sold off in little portions it could
well be that someone else holds them...
Infogrames has never expressed the intend to revive Atari computers, all they
wanted was the rights on the Atari logo, which is known worldwide. Having to
promote the Infogrames label to the level that it is known as the Atari label
would probably have costed more then the aquisition of Atari itself.
As for older ROM versions being distributed, when these are official Atari ROMs
the dealer/distributor most likely paid Atari for it... I think many of the ROMs
these days are from salvaged ST's... a 1040 can be picked up for free these days,
but the chips inside are still worth something to some dealers, there were well
over 3 million ST's sold, where are they all gone to?

>People who insist on using 4 meg ST's or whatnot can have their lifestyle
>and they can have their programs. They can have their closed mindedness and
>fear of advancement into a better computing life.

Oh come on!! why is it so hard to grasp that running several apps at once for
some people isn't a priority? Take a very good look at what's available for
Atari, except for Calamus nearly everything runs just fine in 4MB, leaving

enough RAM left to to whatever it is these people do...
Some people also keep on using these machines because they like to work with the original hardware and software that was intended for it. What are your views on someone driving an old timer?

>If the entire industry had that mindset computers wouldn't be where
>they were today.

I'm not really all that impressed with todays industry.... except for faster processors, what's been happening lately which was really amazing? Everything has to be so damn cheap these days, that hardly anyone can afford to invest in research and development and it shows.... Atari and Commodore used to spend large portions of their revenues on research and development, these days customers are being tricked into bying a new "more powerfull" computer to be able to run the latest apps, these apps don't really change or offer anything new, all they do is present the same crap but with a different skin.

>Granted today's computers have their problems but *I* personally feel that
>it's quite nice to be able to go out and buy a machine that outpowers my
>atari 10fold for $300USD with monitor.

Like you said, these are your personal feelings.... I wouldn't want one of those $300 machines if they offered them for free. It's all very relative to begin with... on paper a TT outpowers an ST also, but in practice it's a different story. Can you type ten times faster on that $300 mindblowing machine? I think not... so when using the Atari for anything that requires keyboard input, there's no advantage.

>Octopus should run fairly comfortable on a 1 meg ST. Damn, it's only a BBS
>package...

I *know* it runs on a 1 meg ST, but after all the whining and rambling on about having to stop support for ST computers, I find it only normal that you would prevent it to run on those computers... but hey, don't mind me, release ST compatible software as much as you like and then come moaning about it in here !!!

>oh and if you read correctly I didn't write Octopus, so if you want to
>slander that too, have fun insulting Koos Kuil who devoted 2 years
>of his life into the BBS package. If anyone actually bothered to look at
>it, they would see that it is even better then Ratsoft.

Hey, I'm just a dumb ass...
Being a dumb ass means I have a terrible memory, so I store all the posts, to refresh that terrible memory of mine....

Oh, and I'm still waiting to see that post where I slander people.

Cheers from Belgium
Dennis

>possible. Ideas as to what is happening?

There are lots of ramdisks around but only very few can handle upper and
lower case, long file names and filenames that contain spaces, weird
characters or multiple periods...

I'm using XFS Ramdisk from Thomas Binder here for quite a while now without
any problems. One of the features I like about it is that it's a dynamical
ramdisk, you don't have to reserve memory for it, it allocates memory when
needed and release it accordingly. With 256MB available RAM this feature is
meaningless to you ofcourse, but it might be a solution for people who have
to keep an eye on free memory left...
The XFS Ramdisk is the only one that I know which can tell the difference
between files in lower and upper case, if you look inside the cache of CAB
you'll notice a lot of files with "weird" names... as a MiNT user it's also
very suited for you, because it can handle Unix-type styles and also can be
addressed from drive U:/

The XFS Ramdisk only runs in a multitasking environment, there are separate
versions for MiNT and MagiC available and is freeware. But unfortunately I
haven't got the MiNT version here, and on top of that can't find Thomas his
URL either.... but someone here is bound to know it.

Cheers from Belgium

There's nothing to change in Emailer, all the settings are made in
IConf/IConnect.

Are you able to browse the Internet with the IConnect CAB overlay module?
That will at least prove that your connection actually works.

You could also try con_info.prg from the Tools folder to see if IConnect has
resolved your news and mail servers.

Most problems are caused by not running HSModem components and sockets.prg in
the right order.

Cheers

It works fine, but I don't like the way that it fills the background window
with pictures of WW1 biplanes ("kites"). Freedom is a much more powerful
selector IMHO.

>I concur, Cubeat don't run in my Falcon either, same 'no key, goodbye'

ISTR in the dim and distant past that someone found that he could use a ROM-
port connected scanner if the Falcon's cache was switched off. This option
appears in one of the setup-type CPXs IIRC.

Maybe this solution would work for the Cubase hardware key also.

Don't forget that you can lower the back of the printer to switch off the
heater and fan.

I made up an adaptor for mine (long since gone) which powered the controller
box separately, so I could leave the actual printer off until I wanted to use
it.

HI all

Just curious whether there is an archive for games boxes/packages etc
for the Atari's?

I know there is one somewhere for the Speccy, I've been asked for a
couple of piccys for it, but would be nice to have one for the Atari
community whether they are used for reference or selling items.

Hi all,

I dontk now if anyone used the BIOS TRAPs on the ST, though I am formatting a disc with these calls, it works fine though 22sectors and 11 sectors does not work. I know the drive will do this since it works in ECOPY to format to these options. Has anyone any idea why I should get errors with 11,22 ? I get error "-16" returned in DREG(0).

Thanks,
Chris

> previous versions.

Well that attitude annoys me, I've bought every version ever made available, worked with Dealers to promote this software, I've been directly responsible for the sale of at least 20 copies, I've worked to highlight bugs and problems with 3rd party software, I've also helped in its English translation, but what the hell, its only one user what inclination does he have to fix it!.

> Btw. any idea why did he change the time routines anyway- what was wrong
> with the old ones?

I think it was to alleviate Y2K issues with 3rd party software.

> Maybe it would be possible to locate the time routines in the old magic.ram
> and patch them into the new version...

I doubt it would be that simple.

Hello.

I like the sedt editor, by Anker Berg-Sonne, which is available at http://users.rcn.com/anker/sedt/sedt.htm . (That's really just so that you know I know about that site and don't tell me to go there.)

I am trying to get copies of sedt for Atari ST, and any other things for sedt that aren't mentioned on Anker's web site, both compiled programs and source code that anyone might have.

(Apparently some people other than Anker would have had access to the source code, and all the code he still has is on his web site - but that's not all of the code that used to exist).

I know that the Atari ST version was available on various BBS's in the past, but I can find very few reference to it on the net, and they are either broken or don't actually lead to any code or programs.

Any feedback appreciated, thanks.

lol that's going to be a long time project... I know we've got over 1,000 various Atari games/programs, etc... including Atari 7800/2600 games... man that's gonna be a lot of cataloging.. good luck!

Is it true for IDE drives that extra space is simply ignored? I'm
considering adding a 2.5" drive to my Falcon, but have no need for 14
1 GB partitions. Two or three would do nicely.

probably the ST implementation of the trap is not clever enough to
do it. However I can provide you some (currently not very well
tested) source code to format a track (the source code to implement
what the flopfmt XBIOS trap does) and you can adapt it from there.
See

http://cvs.sourceforge.net/cgi-bin/viewcvs.cgi/emutos/emutos/bios/floppy.c

at lines 492 and later (function flopfmt).

I wrote most of this piece of code so I can explain it if you
have any questions.

Laurent.

I can't believe I didn't know about the Caramel Corn recipe. Thanks,
Michael.

As for PageStream (or PS2 as we used to refer to it way before the
Playstation existed), it still gets frequent work around my house,
generating CD labels and cases, calendars, the occasional sheet of
graph paper, and (a new use!) creating the special lined paper for my
first grader's sentences.

> or MagiC? I'm not really convinced about the tale of following the Atari guide
> lines either, Atari released MiNT in 1993, I doubt that the guidelines given in
> 1989 were still representative.

For example, for the longest time Atari suggested to only use GEMDOS
calls, avoid lineA (although they work great on the ST) and such
guidelines. And MiNT was not even there when they had those rules.
Coders could get faster programs if they use the forbidden rules.
So they used them, either for speed (most likely), or lazyness (less code
to write).
When MiNT came out, and other machine came out (falcon/TT and all), all
of the sudden, Atari rules totally applied. Those "hacks" would not work
as expected. No wonder, coders have been warned.
What happens if you use different screen resolution?
Progs started to break.
What happens if you add a graphic card?
Progs started to break
What happens if you use virtual memory, and/or over 4meg of physical mem?
Progs started to break
What happens when you use preemptive multitasking?
Progs started to break
What happens when you didn't use proper malloc() in a multitasking OS?
Progs started to break and/or take the system down
The list goes on and on.

Funny enough, OLD program following the rules that Atari set (before
magic/mint) work on all OS, all hardware, all emulator, graphic card
extension, all resolution, all languages etc.
They followed guidelines, sure at the time they might have been slower
then their "competition".

Programmers shot themselves in the foot along with the users who thought
the ST was an incredible machine for ALL usage. No need to upgrade, either
OS, extension or hardware. But oh well, such is life.

Hello,

No I did not use Cabload here. I just clicked on the word "download".

The problem seemed to lie in the Cab.ovl file. If I use an older version
(1.3101) instead of the newest one, the file downloads with no problem
(except for changing the name).

Hello John,

I would say no problem. It is a very good file selector with many options. No fancy graphics, but functions well. If it works on my Hades, then it should work on a Falcon.

For that kind of useage then, DatabaseST is overkill as well:
Why not use a flat file then?
or even just a spreadsheet program?

Use the right tool for the right task.

There is always one, but now I've found two...

Funny! I do own atari computers/arcade/video games and just so happens
that my 1040stf died and I can't complete converting the ST disk I
have to image files to use in emulators. The same ones you download
from the other groups to play or find on sites like Little green
desktop.
Maybe I should just give it up and throw them all away and then you'll
never get to see the incompleted titles and other developements that I
and others worked on and was never published for/by Atari.

Thanks Jared...

I don't really need an Amiga, I'm in need of a replacement Atari ST to
finish a project to convert my old floppies to post and donate for
emulation.
Can't read most of them or copy them under the emulators available...

Crazy? yes, I would have to say.... it's all extra equipment I have
from a upgrade we did at work. Gateway changed models on us and we
spec'd what we would keep and the rest were scrapped. I took a box to
use for mini MAME cabinets we are working on and the others I refurb'd
into working ones and trading them off to help finish projects.

If you really do want one??? let me know what else you would be
willing to trade and we'll work something out.

Later,
James

First of all, I need to know what financial value you place on that PII/300 laptop. I have a socket 370 minitower system I made reliable again by replacing *13* capacitors on it. It will go up to a PIII/800 and 512Mb of RAM. Uses the Intel 810e chipset for video/audio and shares system memory for video. No AGP slot, sadly, but it boots up right fast for me. Currently has a Celeron 366MHz on it and 256Mb of RAM.

I might be willing to trade it for that PII/300 laptop, if you're interested. Can't say I have much else available for trade, 'cause, well... I don't!

Can you tell me all the juicy details (good and bad) about it?

My wife would be very grateful if I used my computer in the house (hence the desire for a laptop) instead of way out here in the backyard workshop...

Jared

1678. Re: FT/ Trade, Looking for Atari systems to trade (0/1)

Newsgroup: comp.sys.atari.st
Date: 2002-08-14 07:37:49 UTC
From: Mark Duckworth <mduckworth@anti-spam.atari-source.com>
Message-ID: <1029310670.127400@pikachu.atari-source.com>
Source record: 32937

What is up with that attitude?

Maybe I happen to have 12 520ST's in my basement that I'd like to get rid of and just so happens that I need a PII-300. This isn't the case but I bet I know people that wouldn't mind giving up an Atari for one of those machines because yes a 1040ST is worth (in my mind) about the same as a PII-300 laptop due to depreciation of the pc hardware and appreciation in rarity and character of the atari hardware.

Regardless of the situation, let the guy peddle his PC systems. We like people to use Atari's and someone out there probably has a use for an old gateway laptop. So no harm no foul. You however posted what.. 12 of the same message?

Who did worse? ;-)

Mark

1679. Re: FT/ Trade, Looking for Atari systems to trade (0/1)

Newsgroup: comp.sys.atari.st
Date: 2002-08-14 08:01:53 UTC
From: Mark Bedingfield <mark@computercom.nospam.com.au>
Message-ID: <R7o69.1971$xL5.6239@news-server.bigpond.net.au>
Source record: 32938

Point was not to the seller of warez, but to the person who keeps prattling on about how we all need to buy atari. What I said was, that we do not care so much for THAT attitude. If you want a laptop good for you, I am not concerned with the original post. But I am sick of hearing Amiga has this coming and Apple are doing this, and MS are able to do this. I am saying most of you blokes are happy with your Falcons, STs etc. If you wearn't you would buy Amiga. Personally I have one of just about everything - A2000, Macs, Pcs, and Atari (anyone with a spare Acorn). I just wish the poor gentleman who started this thread could of escaped Jared's incecant ramblings. As per the reposts, Telstras mail server was any able to send a confirmation to this workstation, and subsequently Outlook pissed all over the News Server, as below again sorry. Please do not assume I am saying go away with your PC stuff, I am saying GET A LIFE JARED, ATARI IS GONE. And yes that still upsets me a little........

Mark - again

I realize my error quite soon after posting that but I figured after 3 consecutive posts it wasn't worth opening up another just to mention that.

I don't care.... That is that. Legal? Maybe based on the DMCA but last time I checked it isn't even illegal to link directly to warez binaries running on another server. I definately don't have to worry about linking to a site that might have questionable morals behind the scenes. Because if any of the sites in my links ARE questionable, I sure don't know about it. If they are pirateers, they are pirateers and I have nothing to do with it.

> That's not exactly the same thing is it, I've got some of your posts here

I wasn't about to do anything. I don't have the means to the end. I don't have anything to dissect or examine the GAL's on it. It was nothing more then simple exploration and suggestion of a perhaps unpopular idea. You of all people should understand this since you seem to get flamed pretty often for your often unpopular ideas. No different song is being sung. You seem to take my words as gospel or that I am saying do it, when actually I say "it would be cool" or the it would be cool part might even be assumed. But you live in the US and/or England so you would know all about English.

>

Yeah well, that was then and this is now. I don't even know who makes the
Nova. There's no website, no support, whatever. Nothing. There's a
difference between a company supporting something they do and giving up. I
personally believe that if a company stops supporting their product and
it's software and they are able to, that they just should give up the
rights to it and make it freeware. I belive this but I am not FORCING THIS
DOWN THE COMPANY THROAT BY STEALING THEIR STUFF! It would be even better
to release the source code to it. They aren't going to make much if any
money off of it, especially if they won't even sell it to you!

I know this is not the way things are, but this is my preaching. Again,
just an unpopular idea that I chant now and again.

Interesting you should mention that. Dennis you're quite magical at twisting words around... And I quote:

"Mark Duckworth:
I'm not saying it's right to pirate software. I'm not saying it's right to use software without paying for it simply because it's a little difficult to register. But when software authors almost seemingly purposefully make their software difficult to register, have pages and software in other languages and everything else, provide no support and aren't active in the atari community, why should you have to pay for it?

If you're going to sell something, support it. Offer a free copy to people willing to translate it. Offer a free copy to beta testers. Use paypal if you can or some auction payment system. The easier you make it on customers, and the KINDER you are, the more people will buy your software. Strongarm tactics of registration database control and complete insincerity with the notion that people might purchase your software through atari dealers is silly. There's no reason people should pay for an abandoned dead end project like CAB. It should be released to the community and the author should chalk it off as a loss or a good deed. Not as if they would get any more money for it anyway. CAB sucks anyway, highwire will be cool."

---------- snip

Yeah duh Dennis.. Is your English to Belgian language translator broken? I am speaking hyptothetically or philosophically. I'm not telling people to go out and steal cab. And if they do it, that's what I call natural selection! I'm saying "this is the way it SHOULD be, but unfortunately ISN'T". Yes I have horrible morals for being pissed off about no one hacking on cab these days. /me gives Dennis the 1 finger salute.

GNU software is obviously what the Atari community needs. Look at what it has done for the PC world. Look at what it is doing for atari projects like QED, and Octopus. If a project is maintained, sure, closed source and costs money.

I don't even know where I'm driving with this, but I want to pay for my software, but sometimes it's damn impossible or rediculously expensive. What is Calamus like near $1000? Alright fine, I simply won't use it.

I would suggest others do the same thing. For each pay product out there, chances are there's a free product that's as good or better.
---------- snip

Yes Dennis that's exactly it. I was "suggesting that people go steal cab" and not actually suggesting that people NOT USE overpriced poor software and I actually wasn't suggesting that people use GNU software. And I am NOT saying that Calamus is a piece of shit either. If I wanted to say

Calamus was a piece of shit, I would say "Calamus is a piece of donkey shit!", but it isn't. Strange concept.

I don't know how you do things over in your country but in my country if someone has something to say, they say it. They dont' sneak around or be all shady about it. For example. If I wanted to say "Dennis Vermeire is a raving lunatic ASH representative who contorts everything that I say into some huge mental picture that I am an evil software pirating pyromaniac who starts fires and steals 520 ST's at night. He also likes to try to destroy my reputation just because my views are unpopular. COMPLETE hypocracy considering the guy jaunts around here acting like a complete jackass". If I wanted to say something like that I would say it!

>>I don't brag. I inform people. I try to relate to people. Obviously I'm

>

I have no obligation to do anything. That's the interesting thing about offering up free services. I CAN be as biased as I want. That's why there's a comment system on the site. Yet I don't see anyone posting comments. I don't give a rats ass if a newsgroup post is biased. I didn't think very well before I hit post, especially when some wacko Beglian guy is slandering me. On the site it's different and every time I have posted a biased article I write as such in plain english and write why it is biased. That's not wrong in any way.

>>Uhmm, well yeah. That's the root issue I believe. The fact that I can

>

I've never heard a MiNT user go nuts in defense of his favorite operating system. It's more like "I don't know what your problem is but it works great for me.... heh". Uhmm.. and yeah, if that is ASH's way of doing things then they suffer the consequences of having people proclaim MagiC's deadness. It's their method and their problem. Like I said, I call it as I see it, and if someone wants to inform me that I am wrong, that's the point of the reply button. Frankly I'd like to actually hear from some sort of reputable source that MagiC's development is continuing. I'd like to think I didn't waste my money on the SDK.

>

Hrmm.. I don't know how you can make the association that buying used
hardware is murder in the same way that refusing to upgrade from a 520 ST
is. Fact is software drives the community. People never wanted to upgrade
to experience better software. People sit here and say that hardware
drives atari software but that's bs. I think they play more hand in hand.
i.e. Falcon came out and plenty of DSP apps were made an released with the
machine. Hardware didn't drive software, they worked together. Still not
so many Falcon's were sold.

I don't care. There can be christian freaks everywhere around me and I
don't have a problem till they start pressing their religion on me after i
told them to get bent. There can be gang bangers hanging around outside my
house daily as long as they are quiet and don't rob me (and they don't).
And there can be people who love their single tos and singletos apps.
That's all good and great and we all get along together until someone
messes with me. That's the line you seem to have crossed. And I like old
cars, just as I like old Atari's. But there's something about a brand new
BMW Z8 that NO old car can match ;-). IMHO of course.

> different skin.
>

Mmm... Well yes and no. The soundblaster live series cards have a
half-decent DSP in them as well as hardware mp3 encoding. 3d video
hardware is exceptional for what it is designed for. (games) When I think
of today's industry I don't think of just PC's. I think of today's
supercomputers, todays Sun Enterprise servers, today's high performance
rendering workstations, etc. I rather despise commodity PC hardware
because it usually doesn't work for very long before it breaks, kind of
like a cheap car versus a BMW. I think where computers have gone are
excellent. I think the internet has gone the wrong way, nevertheless it is
an integral part of a lot of american lives.

> about it in here !!!

uhmm.. Well yeah genius, why would I purposefully program something to only
work on a Falcon that has no practical need for Falcon hardware. 520 ST
users shouldn't bitch that they can't play with Java. That can be applied
to a lot of thigns, that's what I'm saying.

>
> Hey, I'm just a dumb ass...
> Being a dumb ass means I have a terrible memory, so I store all the posts,

Oh after this post I agree wholeheartedly. Even if you aren't a dumbass the
language processor in your brain is certainly that which resembles the
screen output of a messed up video shifter.

>
> Oh, and I'm still waiting to see that post where I slander people.

And to finish up this cheery post, that thread you speak of where there was so much talk of piracy and stuff that I was "wise" not to respond to. I just read every single post in that thread, all 120 some posts. And you know what. You were the only one who had something bad to say about what I said. Quite a few people agreed with my words directly. Of course they were people who actually knew English perhaps so they could gather that I wasn't telling people to go steal stuff. In fact only the first 5-10 messages of the thread were even related to the original post. Seems everything after that was about Paypal and other stuff. So I don't know what your problem is Dennis but I would highly suggest you stop twisting my words and slandering ME! The proof is cut and pasted above (bitch!)

Hrmm, well this isn't slander but you are definately being a jackass - as usual.
http://groups.google.com/groups?q=Dennis+Vermeire&hl=en&lr=&ie=UTF-8&oe=UTF-8&selm=990382168-30484AEicMi%40gmx.net&rnum=6
Or how about here - I've never witnessed q-funk being a dick .. Maybe a weirdo, but not a dick
http://groups.google.com/groups?q=Dennis+Vermeire&start=10&hl=en&lr=&ie=UTF-8&oe=UTF-8&selm=991482058-75771AEicMi%40gmx.net&rnum=17
Yep, some more
http://groups.google.com/groups?q=Dennis+Vermeire&start=10&hl=en&lr=&ie=UTF-8&oe=UTF-8&selm=920421422-296363AEicMi%40ping.be&rnum=18

Or how about some more hypocracy with Dennis preaching about how we should all accept each other's opinions and eccentricities. Oh well
http://groups.google.com/groups?q=Dennis+Vermeire&start=20&hl=en&lr=&ie=UTF-8&oe=UTF-8&selm=79cb2o%249c5%242%40news3.Belgium.EU.net&rnum=23

No dennis, surprisingly enough I was not able to find any information where you slandered someone. But you slandered me, so I figured it would probably be easy enough to find stuff from elsewhere. But there's no shortage of your whining "help me I have a low self-esteem and am all defensive about everything" posts.

Take care of yourself Dennis. I noticed your tune hath changed in this post. Running out of methods to defend your actions? Oh yeah, and while you are in my newswatch killfile unfortunately you didn't make it into my knode killfile. Oh well, I'll take care of that.

Hi Derryck,

>One of the parts was not fitted well
>
>I wonder who had been fiddling around with it!

It was done by being too hasty to get it all
work. I've had the SLM for months here but
because of lack of space it never got out of his
(original) box...

>I made up an adaptor for mine (long since gone)
>which powered the controller
>box separately, so I could leave the actual
>printer off until I wanted to use
>it.

That should be nice but I have this strange
tendency to keep some Ataristuff unchanged and
original unless I do have a second one...

See you,

Raoul Teulings
3 x TT, 1 x Falcon, 2 x 1040 ST, 2 x Stacy, 1 x STBook, 2 x Portfolio, 1 x Jaguar, 1 x Lynx.

Hi Derryck,

>Are you able to browse the Internet with the
>IConnect CAB overlay module?

Is there one? Where can I get it?

>You could also try con_info.prg from the Tools
>folder to see if IConnect has
>resolved your news and mail servers.

I will!

>Most problems are caused by not running HSModem
>components and sockets.prg in
>the right order.

Isn't so that you don't need HSModem if your
using the MFP's ? And about the right order:
you're right; if that's not correct things won't
work properly.

Thanks and see you,

Raoul Teulings

Source record: 32942

Dennis,

Hmm... Because your post is so long, my response will be short. I had an idea that you did a lot for Atari but not that much. That's pretty excessive and yuo want above and beyond any all of duty. In the sense of what you have accomplished for Atari and what you have done (and other members of DDP), I say thank you from the bottom of my heart.

Alas my personal opinion is that no matter how good or great someone is or how much they have done, if they are going to be rude, cruel or otherwise an asshole then the Atari community really doesn't need them. If you were to leave, we would go on without you, and we wouldn't have those random anger filled replies.

Speaking of the rest of your post, yeah I realize you are Belgian. Perhaps you should think about that next time you go accusing a native English speaker of being a pirate or having no morals. If you think I'm bullshitting you, perhaps you can ask lp to translate my post into extremely simple English or perhaps any native English speaker on here. Even a close friend of yours. You'll quickly see that your interpretation and thereafter accusations of what I said are slanderous.

I don't hate you, and after seeing that list I certainly have more respect for you. Honestly I'd like to get along with you but most of the time people only have one chance and you are in the killfile. Your chance is exhausted. I don't have some sort of god complex either. I am better then you for one and one reason only. I'm not an asshole. I'm as competent at programming as my cat is at breathing fire. Translation - I suck.. big time. And what's your deal with broadcasting your age over mine? Yes I wasn't around for the Atari 8 bit machines, how long will you hold that over my head? At times I can become a bit immature or vulgar but it's because it's pretty easy to flare my temper when I retaliate for some "comment" someone posted about me. Yeah I'll be around in 5 years, but not if this crap keeps up.

Mark

Very interesting that KAOS has magically become public domain in the
mean time. Should I not be the first one to know about this???

On Tue, 13 Aug 2002 at 21:41:27 a message from Amethyst was created on
the subject of Have us Atarians got a software picture archive??.
>lol that's going to be a long time project... I know we've got over 1,000
>various Atari games/programs, etc... including Atari 7800/2600 games... man
>that's gonna be a lot of cataloging.. good luck!
>
>Amethyst

As many know i've been flogging Atari stuff for many a year now, I did
start to scan boxes etc. for use as piccys for items i have for sale. I
dont mind continuing to do that and make the scans etc, available.

At the moment i still have several hundred software packages to test and
try, but will be back to the scanning lark when i start to make my list.
It's not much of an effort to make a note of what piccy is for what.

My main problem is that the hosting services i use has a small bandwidth
limit, as well as a limit of web space. If someone could come up with
the space on their server, then i dont mind helping put something
together:)

Hmm, IIRC the nature of the "FAT" filesystem (and possibly other filesystems as well) is such that it works best when the directory trees and the file counts are not too large- which favors a larger number of (smaller) partitions over a smaller number of larger partitions.

A larger number of partitions is also advantageous (at least to me) in terms of organization, backup, search, shorter paths to files (a path too long causes problems in some older applications), etc.

Unused space (partition) on disk can be used to "mirror" some important data, e.g. the complete boot partition or something similar.

As for partition size, the disk space is rather cheap these days which offers a possibility that partitions are never filled over, say, 40-50% which is advantageos regarding file segmentation, access, etc.

That is nice to hear, but I am still interested to know -WHAT- causes this problem. Is it indeed some kind of timeout?

Thanks for the information, I will check it some time after the 19th.
IIRC I downloaded the 6.10-6.20 update not long ago, so probably it is
the latest file there is, and either ASH never put the patched version
online, or else I am among those for whom the patch wouldn't work.

>Well that attitude annoys me [...]

Well, the author was kind to respond promptly, so maybe we were unjust on him.
Apparently he -did- publish a correction which seems to have disappeared into
the shadows for reasons unknown, and beyond his control.

What surprises me a bit, however, is that it seems that this -last- version
of Magic has reached the so-long-ago-I-don't-remember-it-anymore state.
Unfortunately, it appears that the author is not able to devote as much time
to Magic as we would like :(

>>Maybe it would be possible to locate the time routines in the old magic.ram

I found that the quickest way to lose valuable data after a crash was to have relied on Diamond Back, its the most bug ridden festering piece of shitte ever written when it comes to Tape backup. I switched to Gemar and never lost a single backed up file.

I don't think it's a time out prob. You see I have a cable net
connection. Downloading Porthos just take a sort while (maybe 10 sec.),
even with Cab but yet I do have the same problem as describe by Edward.
At least with the Cab-for-mintnet ovl. With the STing ovl (latest one) I
could download it without problem. For me it looks like an ovl problem.
The exact URL for Porthos is http://www.calamus.net/files/dl.php?File=PorthosD.zip

My guess is that Cab has troubles with the question mark. That's
probably the reason why Cab downloads it as dl.php

Yes, extra space simply remains unused. This is true for IDE as well as
for SCSI drives.
Note that in order to reclaim the unused space later you have to
partition the drive again, losing all data. It's probably better to
create more partitions, even if you don't need them right now. Just
ignore them. Or, *after partitioning*, hide/disable the partitions you
do not need, if your hard disk software can do that. (HDDRIVER can.)

1700. GPL Reminder

Newsgroup: comp.sys.atari.st
Date: 2002-08-14 21:13:56 UTC
From: Mark Duckworth <mduckworth@anti-spam.atari-source.com>
Message-ID: <1029359632.97751@pikachu.atari-source.com>
Source record: 32760

Hello all,

I think it's good and great that people are writing new software. But lately I have seen at least 3 _possible_ GPL violations. (well actually witnessed first hand one but heard of 2 others). Remember, if you are going to use open source code in your programs you cannot charge for them, even a shareware fee. Unless you work out a special license from the software developer that allows you to sell your product commercially (and I think shareware even qualifies as commercially) then you are not allowed to include code. I know Porthos uses code from freetype. This could be a GPL violation but it also might not as the authors like to be friendly to the use of freetype in commercial products so a deal may or may not have been worked out. I also have heard of an Anodyne product being an exact replica of mkisofs with a gem interface. Again, if this is all original code then everything is great, but mkisofs is gpl'd.. period. and I do not have definitive evidence of anyone violating the GPL at all. This is just a heads up to warn people who may not be aware of how the GPL works that they are not allowed to charge when their software links to GPL'd code. If they do, they're hurting us all in the end. Oh yeah, and if you link to GPL'd code, technically your code must be open source as well.

Compare this to linking to mint-lib which primarily has a BSD style freemint license, which allows for unrestricted commercial use linking.

Isn't it funny how the GPL is less free and more restrictive then other licenses but yet it is "free" software? I always loved that irony.. But the GPL is good ;-)

Thanks
Mark

Hm, some confusing answers here...

On a not modified TT you should use Serial 2 set at 115200 bps with a 56K
modem.

Modem 2 has less common speeds that might not work with most modems like
76800 and 153600.

Hsmodem supports the TT modem ports using MFP_TT.PRG and SCC.PRG

Note that if you run Geneva ther might be problems with serial
connections at speeds above 57600 on any serial port if you plan to run
tcp/ip with STinG.

> Remember, if you are
> going to use open source code in your programs you cannot charge for them,
> even a shareware fee.

Bullshit. Read the GPL, bud. You can sell programs, which include GPLed code. But: if a person, who bought software from you, require source code, you are supposed to give all source code to build your app. And you can't deny this request or charge extra for source. And the person is free to do whatever he/she wants with obtained source code, even simply building it and sell new binaries on his/her own. If you use a library under LGPL, as a workaround you can distribute private, non-GPL-based parts of code in binary form (object/library files). So don't freakin' be a wise arse ;) Learn to read first.

Another thing: will someone, who still enjoy some sort of decent human live (go out, date, drink and drive, smoke pot etc.etc.) will ever think about suing anyone on the base of GPL violation because this someone used GPL code to build his/her shareware... But for a lonly old cranky geek it might be a way to bacome world-wide famous by making it into ./org article.... ;)

BTW: most of decent libs are under dual GPL and BSD or PNG/zLib licenses, you are free to choose license, which suits you. In short: BSD means you have to include long boring copyright notice, that's it. PNG/zLib is even better: do whatever you want, don't bother authors.

No offences here! 4N4rchy ru135 ;)

what do you mean? Of course my implementation does not work with 11
sectors either. The job is to create the correct pattern of bytes
in a buffer, then invoke a write track command on the drive controller.
My implementation does all what is required, except the byte pattern
is not the right one for 11 sectors per track: there needs to be less
gap
between sectors, and the sectors probably need to be interweaved.

The best would be, to do a read track on a freshly-formatted 11
sectors floppy to know the correct settings, then change the code.

I wrote my implementation from a book explaining floppy disks.
obviously I can't post the entire book on usenet, so really I can't
provide more general explaination than in this mail.

Laurent.

1705. Forgive me, but... I just can't resist!

Newsgroup: comp.sys.atari.st
Date: 2002-08-14 22:51:49 UTC

Message-ID: <3d5adb50_4@corp.newsgroups.com>
Source record: 32765

In a few days or so, a lady is going to be giving me her old, antiquated PC laptop when she gets a complete minitower setup to replace it with. I'll be getting paid to install Win98 on it, so it's beneficial to me in two ways...

I think the laptop is an old 486 at most. Really of little to no use to me, so why am I bringing this up at all?

What if you had a game system that was completely portable... a bit like a PSOne with the LCD display (is that just an add-on or is it built-in?), but only larger? The whole "hand-held" game system arena is ruled by GameBoy [Advance], so going that route just isn't convenient and would end up being more expensive anyways. But what if... your game system was bigger? Bigger screen. Bigger sound. Faster processor. And...

It was an Atari Lynx II!

[Yuck! Get these rotten tomatoes OFF OF ME!!!]

I know what you're thinking... "Oh, no... Jared's ranting again about his dream to restart Atari".

But... I think the key we have here is:

1) We are approaching from the gaming angel... Infogrames does that.
2) We show them the machine we've just finished and give them the opportunity to SEE the product before commiting to supporting the idea of starting an Atari hardware division.
3) The machine is really little more than a specifically modified PC laptop!

Hey, if Microsoft can get away with building an ultra-awesome game system (which is a huge, tonnage-bound mammoth block of a thing), based on nothing but specialized PC hardware, why can't we do the same with making a laptop game system for Atari?

Atari is best known for games, so why not start from that beginning again?

We're not trying to take over the gaming industry (I think Sony runs the zoo, even if the Xbox is more powerful)... just trying to find a niche like before. Based on name and uniqueness.

I talk as one abnormally possessed, but the fragments of my sanity will prove most useful indeed... if anyone wishes to listen. :-)

Jared

Game Angel is already busy with http://english.gamepark.com/ - the only viable cheap GBA alternative (GB/GBC is dead by now, just like Lynx, NGP, game.com, VMU, PocketStation and Tamagochi). It's true, Japan got SWAN Crystal, but it's backed by ill-fated Bandai, was technically outdated long before released, and only sells because of Final Fantasy 1&2 franchise.

X-Box (x86-based gaming platform) is a multibillion moneysucker for Microsoft Corporation. Do you have a couple of billions behind you to back your plans?

Well, still off topic, but since you mentioned me, what the heck!

Sure, I can translate. Dennis is #3 of 10 users in my killfile. Why?
Well, owning an Atari does not exclude someone from being a complete idiot.
As far as I'm considered he's as bad as sinclap and that flake jared.
Mostly slams things he does not like or agree with. Refuses to do research,
has no concept of unix, or any real working knowledge of MiNT. I certainly
can do without him. The problem is eventually commercial software goes down
the crapper, it's a matter of time. MiNT is the only serious option, and
it will prevail. That's the advantage of open source.

As far Mark, he's one of _many_ very nice people I've met on IRC, he does
alot and I admire that.

: Hello all,

: I think it's good and great that people are writing new software. But
: lately I have seen at least 3 _possible_ GPL violations. (well actually
: witnessed first hand one but heard of 2 others). Remember, if you are
: going to use open source code in your programs you cannot charge for them,

That's not true.

To summarize just a few points out what the GPL says...

It says that if you use any GPL code in your program, then if you
distribute your program you must also distribute the source code of your
program, and you must allow anyone who gets your program to use your code
without paying you.

You can certainly sell your program if you wish. However the people who
buy it are then free to make copies and give it away if they wish.

Poo,

Yes you two are correct but it's essentially the same thing if not in
practice. But nonetheless I apologize for my error ;-) And I'm not a
cranky geek. Just don't want to see someone messing with these and future
authors down the road. I have actually read the GPL through and through
but it's been a while ;-)

Thanks lp. I only wish I had more time to do more. But when you build a gas powered radio control car you have to race it now and again ;-). Yeah and I've been having sleep issues lately so the site is lacking. Oh yeah and court, and 5 dentist appointments, and other surgery, and other stuff. So what I am trying to say is, I don't feel I am doing enough but I do the best I can.

Jared,

What do you want for that Amiga. I've been itching to check out AmigaOS and the likes just to have that experience. That sounds like a nice machine to do so on.

Well, in this case I appologize for calling you cranky geek ;)

I think people can do whatever they want to. After all, if a guy make a program, and he doesn't put it under GPL, even if he is supposed to, no one gets killed ;) It's better then if he wouldn't do anything!

Sad but true, very interesting platforms like Atari, Amiga and Acorn are commercially dead. I wouldn't ever try to make money writing code for them. Actually I won't write anything but try to port SDL, write a demo or two and possibly make a decent cross-platform discmag engine which would include Falcon and ST support (Hello Alive team! your mag rules, but shell have huge space for improvement).

And I will release my work only if I'm happy with results (no average-level products from me, sorry). Binaries only, if source doesn't look nice, and everything, if source code looks sharp :)

BTW: as of yet, I didn't heard about any legal application of GPL. The most tense case was www.mysql.com (authors) vs www.mysql.org (enhanced closed clone). But after all it seems that www.mysql.org gave up. Another funny side effect of GPL is what SN Systems (www.snsys.com), makers of ProDG development kit for Playstation 2, was required to (and they did!) release source code with their enhancements for GCC. This is a very bright example of GPL usage. Anyway, to avoid confuzion, best option is to go for PNG/zLib license. No hassle at all - 0 responsibility. True legally correct PD ;)

>
>That's interesting. What is it about Geneva that prohibits speeds of > 56K?

Nothing, except lost packets.

On a 8 MHz ST:
Modem1 19200 OK with Geneva
MIDI 31250 works in TOS but not Geneva where 7812 is max.

16 MHz MSTe:
Modem2 38400 OK with Geneva. 57600 usable but with some packet loss.

32 MHz TT:
Serial2 57600 OK
Modem2 76800 usable but with some packet loss.

With Magic 6.20 153600 on Modem2 is almost 100% OK but 230400 on Serial2
gives packet losses on this TT.

STinG also has a tendency to lose a little more packets on serial ports
after some time (a few days or so depending on amount of traffic). I
suspect this might be because of memory fragmentation within the STinG
"internal memory" area. This is with the webserver Weblight running.

There's no interfering with the units themselves involved. All you have to do is plug the interface and printer together via back-to-back wired D connectors, all except for the + and - 5V lines, which you run out to a 5V regulated wall-wart :-)

Cheers

This is an extract from the history file for the 6.10 to 6.20 update, You can
see why I thought that the actual file had been fixed:

--snip--

List of the latest modification/remarks for MagiC 6.1=>6.2
==========

```
##############################################################################
# Translation to English by Ekkehard Flessa, 2001-09-13. ef@ektus.de #
# Corrected/checked by Peter West and Derryck Croker (DDP) 18-09-2001#
##############################################################################
```

27.3.99

- (X)BIOS: Negative function numbers no longer crash the system.

5.4.99

- Atari: new routines for real-time clocks. Should glitches occur, please
report.
- Atari: When reading and setting the IKBD clock, values 0..79 should be
interpreted as 2000 through 2079 now. This should only affect older STs
without RTC, though.

--snap--

Andreas, does this prompt your memory?

If you locate the patch file then I'll be glad to host it on my web site, as it
appears that ASH seem to have lost the plot a little?

Cheers

Derryck

Exactly the same problem with the patched MiNT-Net overlay for MagxNet.

I guessed that the file was actually the binary I wanted by its size, so renamed
it and that was that.

Cheers

Derryck

1720. Atari ST/TT/Falcon virus killer (Ultimate Virus Killer 2000) Support Site

Newsgroup: comp.sys.atari.st
Date: 2002-08-15 11:53:48 UTC
From: Richard Karsmakers <sorry@no.spam>
Message-ID: <mh5nlu8b2acfj0l5p8r34fr8gf7mti4mgl@4ax.com>
Source record: 32776
Cross-posted to: alt.comp.virus,comp.sys.atari.st,hacktic.virus

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for about 14 years, and turned shareware a while ago. The latest version, 8.2, was released October 10 2001.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://www.uvk2000.com.
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me via the website and I will refrain from posting to the newgroup in the future.
Thanks for your time.

> correct PD ;)

Interesting. Yes I remember the whole mysql AB stuff. It's sad for
mysql.org seeing as how they weren't being malicious towards mysql ab in
any way. As far as SDL is concerned, it has been ported! Patrice Mandin
has ported SDL a little while ago and thereafter has ported Doom for sure
and I believe quake. I'm pretty sure now hardware accelerated SDL drivers
are being produced. Imagine a day to come where we all have 060

accelerators in our falcons with ATI Radeon cards or some other inexpensive AGP/PCI 3d accelerator card which has SDL hardware acceleration. Suddenly, all SDL apps have that 3d acceleration - cool!. Then we can port xine, or mplayer or other players, granted since they are very x86 centric and might even use x86 asm code it probably wouldn't be a nice port. A quick search of the mplayer devel mailing list reveals that ports have been made to MacOSX, HP-UX, Irix and others, which means we probably have a realistic chance. And also cool is the fact that Aniplayer can do most of what any good linux media player can do as well ;-).

Thanks for the apology! I appreciate it, I'm not cranky, I just care too much, yet not enough to re-read the license apparently ;-)

Nevermind the fact that old laptop LCD's didn't tend to be Active Matrix all
the time. The machine would have to be expensive unless it was something
you built. I didn't read the thread too hard but unless it was active
matrix, a fast scroller game or osmething would probably be pretty
unplayable due to slow screen update

1723. Atari ST Scene Central / STNICCC site

Newsgroup: comp.sys.atari.st
Date: 2002-08-15 11:59:08 UTC
From: Richard Karsmakers <sorry@no.spam>
Message-ID: <no5nluopb6qmj9glgnajl59gprqt7ufbjk@4ax.com>
Source record: 32779
Cross-posted to: alt.demogroups,alt.anybody,alt.www.sites,comp.sys.atari.st,alt.crews.atari

Are you a member of the former 16-bit Atari 'scene'? Did you, perchance, visit the "ST News International Christmas Coding Convention", in Oss, Netherlands, December 1990? Or the reunion in December 2000? Or were you an otherwise active member of the aforementioned scene?

Then you should not wait a second longer and surf over to http://www.stniccc.com to discover that, in fact, there is a totally revamped site that covers these - and other - Atari scene events. It also contains Atari Scene Central, a repository of information on where all Atari 16-bit Scene people are now...

Unfortunately I can't help but I have a question of my own...

How are you building SDL - environment, options etc?

I've recently noted that SDL looks interesting but sadly it considers
cygwin==mingw thus it may be very helpful to have another compilation
target to test my changes against (ie Frank's cygwin m68k).

Suddenly,
> all SDL apps have that 3d acceleration - cool!. Then we can port xine, or

Mark, with all respect, I think things better left as they are... I have a stock MegaST4 and Falcon, and the only enhancement I'm going to put in my Falcon is 68881 chip (because 68k linux can't run without it). The true beauty of particular platform is in it's original design and software library. I wouldn't ever think about buying Milan/Medusa/Hades, even if they would be cheaper then Falcon. I have a bleeding edge Wintel PC for all my rendering/sampling needs, and I have excellent PS2 Linux system from Sony for all my alternative power-computing needs, and I have Sony Clie 760 PDA and Gameboy Advance for my retro (2D) coding pleasures ;)

In demoscene it is a popular thing to try to get maximum out of existing hardware, which means using carefully crafted 68030 assembly code, DSP and possibly FPU to acheive real-time video and sound effects, which no one tought are possible on this platform. Try it, it's real fun! Browsing slashdot.org from CAB on real Falcon - sorry, not my cup of tea...

To summarize: instead of overinvesting in Atari/Amiga/Acorn uber-clones, IMHO it's better to choose fresh alternative platform, like PS2 Linux or iMac or (why not?) used Sun Ultra 10 or RS/6000 140F ;) Thanks to eBay last two are dirt-cheap, and thanks to Sony, first is 200$ (PS2) + 200$ (40gb hdd, nic, usb kbd & mice, svga and software) = just $400!!! For a unix workstation with MIPS5400 system with FPU power equal to P4@1.7GHz system!

My own vision of new economically justified alternative platform would be an ultra-cheap microATX mobo with XScale CPU (cheap!!! lots of BogoMips, small power exhausing, no noisy fan required!!!), no FPU (lookup tables or ARM routines instead), UltraIDE constroller + RivaTNT2 or Radeon 7000 (cheap!!!) chip with VGA and flat-pannel out + Crystal Space 24 bit codec (again - very cheap!!! and excellent quality) + 8xUSB 2.0 (no parallel, no serial, no PS/2, no firewire) + 2xDIMM slots + CF reader socket (CF (cheap! cheap!) instead of floppies) and no PCI/ISA/VME/S100 slots at all! This would be a dream machine for me, and if produced in large quatities, it could be like 20$ per mobo, just all memory and HDD, mount it in MicroATX case, and you are ready to go for Linux powercomputing! All extensions via excellent USB 2.0 (NIC, video editing, MIDI, whatever else you might think of). Also as an option - selling it in custom mini-case (a-la PS2 - use vertical stand if you like it to look like minitower ;)).

You won't beleive me, but I even started learning logic design to be able to build prototype myself. At the time I'll aquire necessary skills (more like 3-5 years) quality of Linux desktop will go through another one or two major milestones (KDE 4? 5? Mozilla 2? 3?) and will be ready for a cheap new platform for masses ;)

I am not able to find the correct place to enable this support
while executing "make config". At least not in the 2.2.19 kernel.

Do I have to do anything special?

Best regards,

Bent Ose

1727. FPU dilemma: 881 or 882?!?

Newsgroup: comp.sys.atari.st
Date: 2002-08-15 16:31:03 UTC
From: dogmeat <KILLALLd0gm3a7SPAM@yahoo.co.uk>
Message-ID: <C_P69.267$iA2.71393463@news.nnrp.ca>
Source record: 32782

I am looking to buy an FPU for my Falcon. Best electronics have both 68881 (50$) and 68882 (60$) in LPCC package. The difference in price in minimal, and 68882 is more advanced (i.e. can bee hardware hacked to operate at 50MHz). So I was considering 68882. But recently I came across info what with 68882 Falcon won't run certain ST apps, which it can run smooth with 68881...

So now I'm in doubt, which FPU should I go for...

Dear Ladies and Gentlemen! Your input will be highly appreciated!

Wuf, wuf! -dogmeat

Yes, I use O. Booklage's last OVL, with CAB 2.8, under MagiC 6.20
and Thing. And STiNG, of course!
And, the name of the file is dl.php, and not porthos.php, as I
wrote it in a previous post...

>I found that the quickest way to lose valuable data after a crash was to have
>relied on Diamond Back, its the most bug ridden festering piece of shitte ever
>written when it comes to Tape backup. I switched to Gemar and never lost a
>single backed up file.

I bought DB III a long time ago, but never could manage to retrieve
anything it wrote on the tapes - though the backups always were
stated OK. This was with my MegaSTF and Viper 525.
I then bought a second hand Falcon, which came with - among others -
Gemar. And then... 1 backup per month, never a problem (except when
I saved corrupted data, then crashed my disk, and...).
So, I suggest you dl the latest release (3.06) from the belgian FTP,
try it for a while (it's a shareware, with some limitations like
a message popping frequently during operation), and if satisfied,
register...

Now see I don't agree with you in some aspects. Naturally there's the people that are all about fairly bone stock STe's and Falcons and I am a bit all for that too since only my Falcon will truly be souped up in the end. But at the same time, even though the demoscene people love to get that extra ounce of performance out of an 030 and whatnot. When it comes to day to day useability apps this cocept fails. Either because the apps are too big to write completely in assembler (we have crazy people in our community that could rewrite windows 2000 in assembler probably ;-)) or because people don't see it as worth it. If they want to get every ounce of performance out of something they'd rather it be a pretty game or demo. Everybody needs games, but we need a fast web browser. That's why I like the highwire concept. I think the only difference between you and me is that I want my Falcon, bone stock, to do what I do in every day life, minus the impossible parts like dvd, divx, etc. I try to use my atari's more then my pc linux boxes ;-)

I have been running a 68882 for a while with no ill effect's. The 68882 I would consider a better buy. If it only affected legacy apps I wouldn't worry to much. Realistically tho, the program has to be written to use the FPU, and if it did use it it should be perfectly aware of how to use it. Any app that didn't work 100% would probably be 80's vintage. Dedicated Falcon apps like Apex will love you for it.

I used to think like that until I seen a Hades060 in real life. ;o)
Everything has an angle, for me the Hades lets me do alot more at once
since the speed allows for some nice tasking. It just does not bog down.
Get more done in less time, but I guess it does depend on what one is doing.
I sold my Falcon, it sat unused next to the Hades. Sad I know, but that
is what happened.

That means that programmers will produce more hacks and incompatibile
software WE have to insist on software quality.

If software is free, in 99% it is create to suit needs of programmer, and
depends only on his skills, and needs. If programmer does not need GEM
interface, you should not think he will do it. Unfortunetly, most
programmers like CLI tools and hate gui's. It is also a some kind of
layziness - they do not do what they doesn't want to. But this type of
layziness do not produce hacks, just programs that are hard to use.

Yes, update to newer version. I don't know if 2.2.x has it, try 2.4.x, it
has it for sure.

Btw, I haven't try it - I just know that it exist and I played Linux a bit
on my Falcon. I would recomend latest 2.4.19 version becose earlier version
had problems with recognizing extended partitions.

I will see if I find time to create an update package that updates
6.01 to 6.20. As I always kept English and French resources up to
date, it would be a pity, if the German version was the only one to be
released. Possibly this version will be 6.21, because I found some
(very!) minor bugs when I developed MagicMacX, and the new keyboard
routine of MagicMacX supports "dead" keys.

> without RTC, though.
>
>--snap--

I understand the above text as that some new routines were introduced and
-that- seems to cause the problem on this type of machine. From Andreas's
post I understood that later he fixed the new routines- but maybe I
misunderstood?

With older versions of Magic and with any other OS (TOS1.4, TOS2.06, TOS+
Geneva...) the clock is read and set OK (note: MegaST has a RP5C15 real-time
clock chip besides the keyboard clock; I do not presume to know which one is
interrogated and set at what occasions).

The problem currently manifests itself as follows:

- Current year is recognized as year 2072
- Time is wrong; always some minutes after 12:00
- Time does not get updated in Xcontrol (always sits at e.g. 12:35)
- Repeated using of a program like SYSINFO resets the time always at 12:35
- Any attempt to -set- the time crashes either the utility or the OS itself.

Btw. is it only on MegaST(e) that this problem appears?

>going to use open source code in your programs you cannot charge for them,

As others have mentioned, that depends on the the specific open source
license, and the GPL has no such restriction.

Of course, there is often little point in trying to sell GPLed software,
since anyone who buys it is free to give copies away (or to sell them,
for that matter).

>include code. I know Porthos uses code from freetype. This could be a GPL

FreeType is not under the GPL.

>worked out. I also have heard of an Anodyne product being an exact replica
>of mkisofs with a gem interface. Again, if this is all original code then
>everything is great, but mkisofs is gpl'd.. period. and I do not have

If the GEM interface is a separate program, calling the GPLed one,
there is no violation.

>do, they're hurting us all in the end. Oh yeah, and if you link to GPL'd
>code, technically your code must be open source as well.

That is not a mere technicality, it's what the GPL is all about.
It's irrelevant whether you modify the GPLed code or use it as is.

>Isn't it funny how the GPL is less free and more restrictive then other

You have misunderstood the FSF concept of 'free software'.

>licenses but yet it is "free" software? I always loved that irony.. But

I don't consider it more restrictive. It simply 'enforces' freedom.
That is, no GPLed code can ever end up in something that is not as
free as the original.

Remember, 'free' in the sense used by the Free Software Foundation
(www.fsf.org) is not 'free' as in 'free beer', but rather 'free speech'.

On the fsf web site they mention the four kinds of freedom they refer to:
- The freedom to run the program, for any purpose (freedom 0).
- The freedom to study how the program works, and adapt it to your needs
(freedom 1). Access to the source code is a precondition for this.
- The freedom to redistribute copies so you can help your neighbor (freedom 2).
- The freedom to improve the program, and release your improvements to

the public, so that the whole community benefits. (freedom 3).
Access to the source code is a precondition for this.

Anyone is of course free to use GPLed code to build a shareware program,
but the GPL will still apply to that shareware program.

Using GPLed code within your own program and then not giving up your
sources on request is little different from any other software piracy.
Ethically, it might even be considered a worse offense.

Correct. But you can *not* sell it as shareware, where the users may copy
the software, and the shareware licence that comes with it requires the user
to pay you a shareware fee. The GPL demands that a user that gets the
software is free to use it for whatever purpose, without paying anything.
Paying to *obtain* the software from you is a different thing.

>deny this request or charge extra for source. And the person is free to do
>whatever he/she wants with obtained source code, even simply building it and

The user can even give away the binaries he got from you without
re-compiling them on their own.

>(go out, date, drink and drive, smoke pot etc.etc.) will ever think about
>suing anyone on the base of GPL violation because this someone used GPL code
>to build his/her shareware... But for a lonly old cranky geek it might be a

Definitely. If I give away some code under GPL, and someone else uses that
to build closeds-source software for which he charges money and restricts
copying, I would be quite pissed off. After all, he is using my works to get
money from his users.

It's quite simple: If you want to sell your software (in the sense that
other users are not free to copy and freely use it), then you must either
use code with compatible licenses (like BSD), or write the stuff yourself.

That should be "FreeType is not _only_ under the GPL.".

You have a choice between a BSD-style license and the GPL.

Yes Martin, that is what I think also. The newest version of Dan Ackerman's
Ovl file (1.401, I think) does not get it all, but version 1.3101 does.
Still, Cab has trouble with that question mark. It was not there before as
far as I can remember.

Freedom (all versions) certainly works on Hades. I've used it for years
but it's hack. I recently switched over to Boxkite because some newer
programs (like Calamus SL2002R3) did have serious problems with freedom
2.05.

I use BoxKite on my Falcon. But a few programs I have do not like it (WordPlus 5, ergo!plus), nothing happens when a fileselector should appear with these programs. But in general I like it.

I also tried Freedom, but never got it working. I think it was that "liberty" autofolder thing that wouldn't load or something like that. I don't know if it is any good if it does work, I finally gave up.

You can add Outline art 3 to the list of program which have
problems with Boxkite. Wordplus 5 seems not to have problems with Boxkite
on my setup. I just did a brief test. I could load/save docs without any
problem.

What I don't like is that Boxkite keep complaining about long file
names when called from certain application. For instance Image copy and
Gemview. If I try to load a picture from a VFAT partition Boxkite always
comes up in 8+3 mode. I always have to switch on long file name support
myself. An djust before Boxkite passes the file to the application I get
that annoying message like this:
This application may not be able to progress long file names correctly.
I know in fact it's not the fault of Boxkite but of Imagecopy but it's
annoying. With Freedom I didn't had this problem at all.

>
>I also tried Freedom, but never got it working. I think it was that
>"liberty" autofolder thing that wouldn't load or something like that. I
>don't know if it is any good if it does work, I finally gave up.

I did love Freedom very much but again some program I use almost
daily has problems with it so...
Also Freedom doesn't like memory protection at all.

True, if it's available only under GPL. Most software is available under
several licenses:

- commercial
- gnu
- png/zlib

at the same time.

You choose commercial if you are ready to pay money and want solid product
support. You choose gpl if you care too much about future and freedoms and
blah blah blah. And you choose png/zlib if you just want to have fun, no
strings attached.

I send stuff back and forth all the time, if its gone from our UK post
office if your lucky then it will take a week, but thats only letters, I
waited 3 months for a small jiffybag to arrive, though from U.S to UK only
took a week. Even saying that if it goes via boat then I wouldn't expect it
anytime this side of Christmass. In short, UK post office here are all thick
fu**ers
who couldn't get a parcle to arrive on time if thier lives depended on it.
I hope you got a better post office than us!

HTH,
Chris

I recently ordered EtherNEC's from the UK. They went out on August 7th (wednesday) and arrived yesterday (thursday) so just over 1 week, as was reported by the person who sent them. PS: I live in philadelphia so it was to the east coast US. I don't know where incoming overseas mail goes but I imagine it can't be far from philly (or might even be philly!)

And that's why I said it was only possibly a GPL violation. Like I said, I'm not trying to start shit or spread FUD, I just wanted to let people know that that stuff is important and that people notice. I figured freetype had a BSD license but I didn't download and check. Anodyne's use of mkisofs is also perfectly legal as far as I can see without actually getting the software. Bah - humbug. I'm only trying to be nice.

1765. HighWire 0.0.8a Public Release

Newsgroup: comp.sys.atari.st
Date: 2002-08-16 19:28:05 UTC
From: Dan <baldrick@youshouldknow.netset.com>
Message-ID: <3d5d51d0$0$1421$6d5eecc5@news.eurekanet.com>
Source record: 32722

Let me start off by apologizing for the delay in this message. I tried to send one out yesterday, but as of 27 hours later it has still to show up on any news server I can find.

In the effort to bring some excitement to these dog days of summer and to give everyone something else to discuss...

The HighWire Development Team would like to announce that the 0.0.8Alpha release of HighWire is now available for your use and entertainment.

Changes in this version include the following.

Extended menu bar, the current charset encoding can be seen and changed at menu title "View". Also de/increasing of the display font is available there.

Menu entry "Info.." will show now some basic information about the active frame.

Right mouse click now opens a popup menu.

Improved algorithm for line breaking to avoid splitting of text lines at wrong positions.

Implementation of memory caching of images avoids multiple loading of the same image. The pseudo URI "about:cache" now shows detailed information about cached images.

Implementation of <frame scrolling=..> attribute.

Bugfix < font > tags inside links breaking colouring.

And much more ..

Download links are on the HighWire site.

HighWire Development Team

http://highwire.atari-users.net

Also of note for programmers is the number of libs available on the coders information page, of the HighWire site (this can be found under join the team).

As of this time the current versions of gemlib, libungif and zlib are available for gcc, PureC and LatticeC.

With the Image caching in place in this release some real comparisons of speed can be made. To get an impression of

the speedup try imgtest.htm with the version 0.0.7 alpha package and compare it to the 0.0.8 alpha package.

Well have some fun and sorry again about the delay in the message.

Thanks Richard,

I needed it bad, I got more than 500 disks given to me by a friend and
they span the ages from 86 - 91 and thanks to yours and others hard
work we can reap the benefits of good virus checking. Also with the
purchase of any software on ebay, it comes in handy.

Thanks for the post, and keep up the good work, I appreciate it.

I fire up my TT now and then for some program tests, but other than that it
seems to sit idle. It would get more use if it was on my LAN. ;o)
One day I hope to do that.

I sold 2 TT's already. I'm down to my last one, and I wish to keep this
one. ;o)
There is one on ebay last I looked, but it was rather pricey, started at
$300 usd.

I do have odds an ends forsale at my webpage:
http://www.q1.net/~atari/

>date, it would be a pity, if the German version was the only one to be

The DDP section of my web site has a package to "Anglicise" 6.20, you are very welcome to take this as a basis for your work Andreas. As reported elsewhere though, the magxdesk.rsc file still contains some untranslated German in hidden objects. I simply haven't had time to look at them yet. We've used our usual style of upper and lowercase for menu items etc BTW.

Contact me by email if you want to take this further:

derryck @ ntlworld . com

with the spaces removed.

Cheers

AFAIK the question mark is included to force the browser to reload the page,
rather than possibly re-use an older cached version of the page (and thus not
get an older version of the binary).

Cheers

The advantage of Freedom! is that you can selectively disable it for those
programs that don't get along with it.

>"liberty" autofolder thing that wouldn't load or something like that. I
>don't know if it is any good if it does work, I finally gave up.

I used the previous version. I don't think that 2.05 adds any worthwhile
features, but ISTR something about being able to execute CPX files?

The PAK factor should be irrelevant as the custom TOS 3.06 clock code is un-modified

> Perhaps Andreas will have the answer.

I emailed him shortly after the release or the 6.2 package and got a reply of complete disinterest.

I was well disappointed especially considering the work I put into promoting Magic. How many people bought Magic following CC Club demo's I wonder?.

Whilst I wholly support registration of Shareware I strongly suggest that any potential registree establish a line of contact with the author before posting money into the void. I never could establish contact with the author, either that or my questions and bug reports were simply ignored!.

It is possible to configure Freedom to provide the system fileselector for specific app's. I've talked to lots of people who's Freedom problems were cured by tweaking its config file.

> I also tried Freedom, but never got it working. I think it was that

I don't like being forced to use someone's proprietary extension system in order to use an app.

I was able to compile kernel 2.4.5 or something with Atari support,
but the fdisk utility could still not find the partitions.
Debian have something called atari-fdisk.

Another way of transfering a lot of files could be through a cd-rom,
but then I have a new problem. How to make the Atari recognize this.

Source record: 32745

A lot of threads ago there was someone who mentioned asort of shadowy image through the regular printout of a SLM804. I seem to have the same problem.What can be done about it? Do I have to replace the drum or is there something less radical? I also notice that there is a lot of toner on the box that contains the tonercartridge. Is that normal or has that been spilled due to transportation of something?

There's still a Epson at the side of the SLM so there is no big fuzz but I would like to use the SLM804 and not only because of his fine printout...

Thanks in advance,

Raoul Teulings

Source record: 32649

Hello,

I just found a bunch of my old ST floppies, and I can't read them on my PCn
although some of them has been formatted with TOS1.4. ST2DOS.EXE complains
about not being able to read their bootsector. I thought Saint could do it,
but apparently it only uses floppy images, not actual floppies.

The drive on my PC reads PC floppies without any problem, but I no longer
have my old ST.

Is there any hope ?

There was a German program which used GDOS to print out ST-Guide texts, I
did play about with it for a while, but don't remember getting very far with
it.

I have gotten packages from the UK and Germany in about 1-2 weeks. There some
others that took longer though.

Hmmm?? Could be the drives in the ST and PC are not compatible. I have run into that before. I just formated a disk on my STe and put into the PC and it worked fine. I would say, just mail the disks to someone who has an Atari and have that person email you the data. I would do it, but if you have someone in your area, that would be better.

For me there is no contest. Boxkite is much better than any other file
selector I have used on the Hades. About the long-filename thing, sometimes I
have to switch on the long filename support, but most of the time I do not. I
have yet to figure out why this happens, but I do not mind it. The bottom
line is that it works.

>I would like to connect a cdrom to my IDEal IDE interface.
>Any good suggestions anybody?
>
>Bent

The newest version of Extendos has some IDE support. Below was cut from a
section of the latest update:
==========

2. Added SCSIDRV support. This allows ExtenDOS Gold to access busses
for which it does not have built-in support: for example, the IDE
bus on the Falcon, or the SCSI bus available via a plug-in board
on the Hades. In order for this to work, a driver that supports
the SCSIDRV protocol on your system must be available; check your
system documentation to see if one is supplied. If not, you may
wish to investigate the HDDRIVER hard disk driver (by Uwe Seimet),
which provides SCSIDRV support on many systems.
NOTE If the SCSIDRV interface is available, ExtenDOS Gold will
use it by default for ALL devices, including those on the standard
Atari ACSI and SCSI buses. In order to use the builtin support
for ACSI and SCSI in these circumstances, you must specify "No"
for the "use SCSIDRV" option (S=N switch). See below for more
information.

3. Added command-set support for ATAPI revisions 1.2 & 2.6, both
CD-ROM & CD-R(W). This means that most modern ATAPI/IDE CD
devices should work on systems with the appropriate hardware
(e.g. Falcon or Milan).
NOTE In order to send the commands across the IDE bus, ExtenDOS
Gold uses the SCSIDRV protocol. Therefore an appropriate SCSIDRV
driver must be installed for the bus in question.

4. The following additional devices are supported:
CD recorders:
. Mustek MRW-121032
. Panasonic 7502
. Plextor PX4/12, PX8/20
. Ricoh 7060S
. Sony 145
. TEAC 50S, 55S
CD-ROM drives:
. Nakamichi MJ-5.16S
. TEAC CD-50, 532S
The default for otherwise unrecognised TEAC SCSI-2 devices has

been changed to be the same as the TEAC 532S. The default for
Yamaha CD-RWs is now the same as other SCSI3/MMC devices.
In addition, SCSI-3/MMC compatibility has been improved, so
more SCSI-3/MMC-compliant drives should work automatically.

I'll not be out of any money, it's a donation by another user that does post here very offen, just doesn't seem to answer e-mail offen. As it's a freebie I figured they'd ship it the "Slow Boat from China" way. but figured I'd just ask.

If it wasn't for some other things that have used up my money, I would have seen if I could have bough a TT keyboard here, but blast it, every time I think I'm going to have a bit of extra money, something goes wrong and I end up broke again.

I have been able to read most of my ST floppies on my 68k Mac.
If the Mac has a translator to read PC disks, it should be able
to read the ST floppies.

By ST Book, are you talking about the small (A5ish), grey ring bound
Software Catalogue with hundreds of pages of all the software and
hardware etc that was (going to be) available for the ST ?

I'm sitting on an excellent UK edition and I have never seen another.
Are they rare?

I cross-compile SDL for atari from my linux box. You need binutils and
gcc to produce m68k-atari-mint code. Then you need the mintlib include
and libs to build the final program. See my WWW site for more info on
this, there are cross-compilation howto pages.

Better keep in mind that HDDriver is still a commercial (and supported)
product. You can find a demoversion and some information on it here:

http://www.seimet.de/hddriver_english.html

There is 2mb on the motherboard. Atari themselves sold 2mb and 8mb addon boards, so you could have 4mb or 10mb total. I do not know about any third party boards, there may have been some. If so they are almost certainly not made anymore. Over here (US) if you find a board at a dealer they want a fortune for it.

STbook was an Atari laptop which from what I saw was MUCH better (smaller)
then the STacy.

Mark
I think it was only prototype and never made it to production but there's a
couple flying around.

Do I have to do anything special with the HDDRIVER??
Is there some SCSI simulation for IDE devices?

HDDRIVER list the CD-ROM at bootup, but the EXTENDOS does not find
any devices.

1832. Re: SLM804

Newsgroup: comp.sys.atari.st
Date: 2002-08-18 22:43:39 UTC
From: Jim DeClercq <jimd@panix2.panix.com>
Message-ID: <ajp7ur$3b0$1@reader2.panix.com>
Source record: 32689

The first thing to do is confirm that what is probably
the problem is the problem. Take out the wiper blade, which
is just behind the drum, by removing two screws. It
probably looks yellowed, because even a new one is 20 years
old. Rub then end surface on a flat file, and put it back in.
If that helps, you need a new wiper blade.

One Australian fellow posted that he had some new ones,
not old stock but really new, but would not ship outside of
australia. One other person said he knew how to make them,
but nobody wanted to buy one from him. Still true, I guess.

I made one for me. I took an Epson CX blade, and, lacking
a bending press, bashed it out flat with a big hammer, and
then bent the metal holding the plastic wiper blade to exactly
15 degrees, to match the old one. Then I cut away everything
that did not fit, and made new mounting holes, so that the
new blade would not fold over against the drum. It should
not lean very hard against the drum.

Actual hole position is hard to measure, but it is about
1/2 inch behind the working tip of the wiper blade.

This is a small bother to do, and I could make another,
but someone recently posted that he was looking for
that business. He could probaly sell a dozen or so.
There are at least that many people with an SLM804 parked and
waiting for a new wiper blade.

Mine works fine, but looks like it was done with a big hammer.
It is not pretty, but it works.

Topic two: toner on top of the box is a bad sign. If that
was shipped without removing the drum and toner, there could
be conductive toner everywhere, and you will soon get
proficient at taking a SLM804 apart into really small
pieces. If it is causing no trouble, do not worry about it.

Jim

Raoul Teulings <rt@xs4all.nl> writes:

: A lot of threads ago there was someone who

The newer Power Macs have *no* floppy drives at all...perhaps your
friend has an older model. The one I used was a 68k Mac, and the
reading as automatic and required *no* special efforts...

1839. Re: Forgive me, but... I just can't resist!

Newsgroup: comp.sys.atari.st
Date: 2002-08-19 04:10:14 UTC
From: Jared Falvo <luposian@azob.quik.com>
Message-ID: <3d606bea$1_3@corp.newsgroups.com>
Source record: 32546

It's a nice idea, I think, but will probably never happen. But I'll certainly pursue it as far as I can. If it's "affordable" to attempt ($50,000 or less to make the prototype) by an outside entity with bucks, I may submit the idea to Infogrames and see if they bite. Can't hurt to try, but wish I could finance it with my own money... I'd feel better taking the risk myself than pitching it to someone else and having it fail, for whatever reason. It looks better when you die on your own two feet (taking the risk yourself) than having someone else saying "you duped us!" I think it shows more integrity. But, sadly, I shall never see the kind of money a project like this would require... and, so, it simply MUST be pitched to someone else with more money than I shall ever see.

BTW, anyone wanna see my sketch drawing of what it might look like? Remember... it's going to be based on laptop case design (same foldable case and LCD display), but a pure game system otherwise.

Personally, I don't understand why someone else hasn't done this yet... it would be sooo cool! I mean, can you imagine an XBOX in a laptop case? You *KNOW* they could do it. Might even buy one JUST to have such an awesome game system in that size package!

I think I should update my previous specification... the "Lynx II LTGS" should have Jaguar-quality gaming performance. The Jaguar II LTGS should have Dreamcast quality performance.

$300 price tag (max) for the Jaguar II LTGS. $200 price tag (max) for the Lynx II LTGS. Seem reasonable?

sigh Such dreams that shall probably never see the light of day...

Jared

> - commercial
> - gnu
> - png/zlib

Code that is avialible under GPL is avialible *ONLY* under GPL. If similar
code is avialible under other license then it was developed without using
any GPL code (even if it looks similar and the same person wrote it).

GPL license does not allow to distribute GPL software under any other license
that would make software less free than it is with GPL.

1843. AB040 wiring?

Newsgroup: comp.sys.atari.st
Date: 2002-08-19 08:54:54 UTC
From: purpletwilight3000@yahoo.co.uk
Message-ID: <2bfabd3.0208190054.735333bc@posting.google.com>
Source record: 32553

Finally got round to fixing some Falcons
that need attention. I have one fitted with
an AB040 card - but there is a loose wire from
the 8 pin connector block on the top side of
the AB040 card. Its from pin 1. Does anyone know
where this goes?

Also there appears to be a wire from F2 (Fuse 2)
on the Falcon main board (no fuse is fitted) on
the Falcon PCB through a fuse holder to a loose
wire - again any one know where this might go.

This is a professionally re-housed Falcon in a
PC tower case so its powered of a PC PSU if thats
significant.

Thanks

PT.

1844. Re: SLM804

I'm the aussie Hp/canon technician, also with a fetish for atari gear...

Rather than bother with those old Tec based lasers atari uses, I'm trying to find out wether the Atari controler will work with the Canon video interface, if so, much newer and better printers can be connected to the atari controller, using the same driver, and the printers would actualy be servicable, with better print quality. Just waiting for a printer to come in with the optional video interface to try it out, i beleive it will work.

I will call up one of my dealers and see if i can get maybe 50 slm804 wiperblades manufactured, i dont think they would bother for any less, so maybe i will have to sell to people maybe 5 at a time, i will see.. Due to lack of interest ive never really bothered persuing it.. If there were hundreds of people with these printers wanting drums/wiperblades, something could be sorted..

alternativly, you can just peal off the the rubber and replace it with a new strip, this may be another avenue...

I will wait for a responce about manufacturing them anyway... I will let you know.

>>The DDP section of my web site has a package to "Anglicise" 6.20,

>And, unfortunately, there are some texts embedded in the binary of magxdesk,
>and, iirc, those texts appear rather frequently in normal use.

Andreas will be able to sort that out without a problem though.

If nothing comes of an official English release of MagiC 6.20, I may well be
able to provide a solution for the binary (and AES etc) sometime soon.

I'd prefer an official solution though, not least because it's likely to
include the clock patch that Andreas mentioned earlier.

Cheers

Indeed, he's got some books I want but I've decided to wait until they
appear on ebay. Since I KNOW when to stop bidding and I can use my
credit card! :oP

Hi All,
Although this is not Atari related, I feel that in the Atari spirit I
should share this info:

I received an E-mail stateing that my account info was flushed, lost
and to re-enter it by going to earthlinkservice.net. Since I have
trouble with SSL, I called them and they said the letter was false and
the address is wrong and may be a re-direct.

I remember eon's ago getting something similar to a
wordprocessor on an st format coverdisk, the difference being, what I
typed, the st would read back to me.

Does anyone know what this was called, or if a similar program exists,
and where I might find it.

Thanks.. RJ

: Is there any hope ?

The big problem is that the atari format does not write some key bytes of data onto the diskette. In fact, at the hardware level the PC reads the diskette just fine, but the operating system tells you there's an error because it isn't sure the diskette is in the correct format because those bytes in the boot area have the wrong values.

It's also possible that the atari diskette is formatted with more than the normal number of tracks, in which case soem pc diskette drives may have a hard time reading the disk. In this case a different PC might be able to read the disk.

There is at least one gem emulator program for PC/windows that can be used to read the diskette. It works because it's disk access does not check the signature bytes mentioned above.

In the past I have read these diskettes on my PC using linux. I forget the details I used, perhaps the diskette could be read directly, or I might have used a program such as dd to transfer the data from the atari disk to a preformatted PC diskette. Format the PC diskette ahead of time with the same format as the atari (normally just 720 K), and then use dd to skip some bytes at the start of each diskette and simply copy the rest. The result should be a PC compatible diskette with the atari data layout.

IIRC, Linux is pretty smart about handling Atari ST floppies, so a
normal "mount" command should do the trick. It's been a while since
I've tried this, though, so I can't make any promises. The Linux/UNIX
mtools package may also be worth a try. This package includes commands
like those in DOS, but with "m" prepended (mdir, mcopy, etc.), to
access DOS floppies. IIRC, it's not as good as handling Atari ST
floppies as Linux, but it might work.

In either case, even if you don't normally run Linux, you can try these
by using a Linux demo CD, like SuSE's demo CD or DemoLinux. Check
http://www.linuxiso.org for links to some of these. Download the image
file and burn it to CD-R *AS AN IMAGE FILE* (the file includes an
ISO-9660 filesystem, so it needs to be copied "raw"). Most Windows CD-R
packages will do this if you double-click the image file or select an
option called "burn from ISO image," "create disc from image file," or
something similar.

1869. SCSI chains

Newsgroup: comp.sys.atari.st
Date: 2002-08-19 21:40:28 UTC
From: Neil Chester <neil@adel6.freeserve.co.uk>
Message-ID: <1029789732-322858AEicMi@adel6.freeserve.co.uk>
Source record: 32575

Hi All

After purchasing an Adtron PC Card Reader earlier this year, and sorting out the strange case of the extra LUN associated with it, I now find that this third device upsets the rest of the chain!!

Physical chain ID# HD Driver setup
Falcon CT2B 7 7.00
CDRW 1 1.00
GT9500 2 2.00
Adtron 6 6.00 (with test 2 LUN - OFF) TERMINATED

I found that trying to use the CDRW without the Adtron being ON was impossible - in fact before I switched ON the Adtron no CDs were recognised by the system!! This was the same when operating the Adtron without the CDRW being ON - the card could be read but the files according to Kobold were corrupt and JPGs were corrupt according to PhotoTip, Aniplay and IC4+.

I then switched ON the CDRW and these problems disappeared although I did get corrupted images on screen when I tried to load the pictures into PhotoTip directly from the Card Reader. I then copied the same pictures onto a hard drive and there was no problems apart from 1 with a bit of Huffman corruption. Is there some sort of interference on the chain?

Is there anyway of curing this? I am using HD Driver v8.04 & Magic 6.20, also Extendos Gold v3.40 (for the CDRW).

Any thoughts would be helpful!

Thanx

Neil :-)

I have some of the 2mb ST ram boards, if anyone in the UK can find some 1mb
x 4 20 pin DIPS, one of the boards is already socketed for upgrade......

Suitable chips are
a.. MN414400-70
b.. TMS44400DM-10
c.. uPD424400AGS-80
d.. HM514410AT-8
e.. KM44C1000BV-8
f.. MB814400A-80
g.. TC514400AFT-80
Need 16 for each board, must be DIPS not J legs.

Barrie at Keychange. www.keychange.co.uk

What in the world would be the market for this game machine/laptop display device?

home user? no, because you would use your existing PC or a machine hooked to the TV

traveler? no, too big, not enough battery life

just who would you sell these to in enough quantities for a major corp to even look at you??

SCSI Interface, Atari-workshop.co.uk or myatari.com, IDE interface search google for "Mario Becroft" and you'll find him. I think his website is at gem.wiz.co.nz. He sells an IDE interface but I don't know what his status. There's other interfaces that someone will surely chime in with.

Hi All

This morning,Simon (of Unstable Sounds...or Unstable Simon as he is called on Atari-MIDI:-) told me about MIDIVIEW , a MIDI monitor program by Jim Johnson (Tunesmith) that was in an ST mag cover disc as well as an article. I wrote Jim, and he agreed to a freeware release. So I quickly made the page and it is now available:

http://tamw.atari-users.net/midiview.htm

Hows that for a Quick Draw McGraw!!??

This seems like a great program...try it! I immediatly found out my Yamaha PSR510 sends Active Sensing messages!! All this time I was wondering why it acted up on certain MIDI programs!

1880. Atari Memory Upgrade manuals Online

Newsgroup: comp.sys.atari.st
Date: 2002-08-20 05:24:44 UTC
From: Don <atari@qnet.com>
Message-ID: <3D61D29C.9FC5EF1E@qnet.com>
Source record: 32586

I have posted a few memory upgrade manuals online. I have a couple more
to add and will do so soon. Thanks to the few people who sent me copies
of the manuals they had. If you would like to add to this please email
me the manual.

Check it out at

http://www.qnet.com/~dons

Theres some other Atari items of interest ther too.

Thanks,
Don

1881. Cubase Audio Pitch Change

Newsgroup: comp.sys.atari.st
Date: 2002-08-20 06:22:32 UTC
From: <>
Message-ID: <lel89.2126$Xk2.248701152@newssvr16.news.prodigy.com>
Source record: 32587

When I try to record a stereo track (choosing "any" for channel) in Cubase Audio Falcon, the pitch is lowered significantly (It sounds really cool, but would only work for a sound effect :-)). It works fine with a mono track. I'm new to this, and I have an Falcon Digital Interface attached (no Cubase clock). In addition, I cannot bring up the MIDI mixer. The module is installed. Thanks in advance!

>After purchasing an Adtron PC Card Reader earlier this year, and sorting
>out the strange case of the extra LUN associated with it, I now find that
>this third device upsets the rest of the chain!!

Sounds like a termination issue to me - does the card reader have active
termination? If it's anything like the Zip drive then you have to have it
switched on to activate termination.

I'd recommend double- and triple-checking that all terminations are removed,
and if possible, select external termination on that card reader and use a
good quality terminator block. And at least one device should provide TERMPWR
to the bus, although your Falcon should take care of that.

First though try the reader in the chain by itself and see what happens.

Cheers

You must use the same sampling rate for playback as you did for record. Cubase
experts will give chapter and verse, but this is the most likely candidate.

1892. [PRG] Mad cow for Atari :-)

Newsgroup: comp.sys.atari.st
Date: 2002-08-20 13:54:01 UTC
From: atarirulez@go2.pl
Message-ID: <ajthlo$g3e$1@news.tpi.pl>
Source record: 32597

Hi,

In my endless Atari devotion I have just prepared an extremally
useless application ;-) It is... erm... it is a multimedia tutorial
for you to learn how to recognise a mad cow disease :-)

You need Atari STE, TT or Falcon. It does not work with ST.
Works even in monochrome, but 16 color display is suggested.
Sorry, the images are in 16 colors only (no 256 color ones) ;-(

This is a conversion of a Windows program called KROWY.EXE.
The texts are translated into English.

See it for yourself at http://gregory.atari.pl/madcow.htm
and have fun!

Yes, exactly. HDDRIVER provides SCSI emulations for IDE drives and ATAPI devices (which is not the same). The HDDRIVER manual provides more information. Note that HDDRIVER is commercial software. What's your registration number?

This is definitely a problem caused by your hardware. The SCSI standard mandates that devices that are switched off must not influence other devices. If they do something is wrong. With cables are termination, or even with the device electronics.

Hi,

The STE uses 30 pinn SIMM memory modules.
If all slots are filled, it either has 1mb (4 x 256kb) or 4mb (4 x 1mb) ram.
(OK, it is possible to have 2.5 mb, but not without a patch program.)

I'm facing a sort of similair problem with a MP7040S Ricoh CD-R/RW and a Quantum Fireball SE harddisk. The Ricoh simply doesn't like the Quantum drive at all!

When powered up together something hangs the burner totally. It does not show up un HDDriver and even the eject button refuses to work!

This happens even on the simpliest of setups: the Quantum drive connected only with the burner with a single short flat cable and both terminated. No computer involved. The same eject button failure occurs here too.

But, if I first power up all other items on the chain, the Quantum and three other harddisks and a TT, and then manually connect the power connector to the burner after a few seconds everything is just fine!

It looks like the Quantum drive sends something out on the bus that kills the burner on startup.

The Quantum drive is a SCSI-3 device that requires initiator identification and is not possible to boot from on my TT.

I'm planning to solve this dilemma by simply add a delay power up relay to the CD burner.

Another possible solution would be if there are any other "soft settings" than those that show up in HDDRUTIL?

I don't know why it would be different for stereo, but check to see
that the sample rate is not being changed somehow. Is your FDI hooked
up to a DAT? Does the sample rate changed on it?

news:Pug89.20154$Dw2.5919@nwrddc01.gnilink.net...
> What in the world would be the market for this game machine/laptop display
> device?

The person who wants games *exclusive* to it... games like remakes of Adventure, Haunted House, Dodge-Em, Circus Atari, etc. The fact that they are remakes of old 2600 games makes them even better... because almost no one has done them (I think Circus Linux is the only one)!

> home user? no, because you would use your existing PC or a machine hooked
> to the TV

The person who wants both worlds in one package. There are probably more of them than you think.

> traveler? no, too big, not enough battery life

It's a game system, not a true laptop... if you use a Via C3 processor (lowest of all Socket 370 processors on power requirement) and solid state HD, with automatic screen shutdown after so many minutes of inactivity (or the pause button is hit, which shuts the screen down and "hibernates" the game) and such, you should be able to squeeze at least 1-2 hours of gameplay per battery charge. Have two batteries in it (my wife's Sony Vaio has a spare battery compartment) and you've just doubled your game time.

> just who would you sell these to in enough quantities for a major corp to
> even look at you??

People like those I've mentioned. I have little to no doubt it *could* work... but so could restoring Atari and bringing back Atari computers... not that anyone ever listens to me.

It's the how of making them affordable that's the hard part... you *might* be able to build the prototype cheap enough, to show by getting a cheap laptop off eBay, tearing it apart and making some fill-in/adapted plastics for the now non-existant keyboard/trackpad, adapting a top-load CD-ROM drive to the keyboard area and such... The thing would definately look mickey-moused, but... when you had a few games written for it and showed it off... I think the "concept" might just sell!

I looking into the viability of DOS games for speed and performance. FreeDOS would be your OS. OpenGEM would be your user-options interface (only shown if there is no CD- in the drive, otherwise the game loads immediately off the CD). The hardware isn't what makes money (so making it as cheap/affordable as possible is key)... it's the games!

Anyone want to see my rough concept draft?

I mean, can you tell me you wouldsn't absolutely salivate at seeing a new Atari game system, housed in a sleek laptop-styled case? You can play games on the road (even off road... the solid-state HD has no moving parts, so it can take lots of abuse) when you like and plug it in to your big-screen A/V-capable TV (plug in the wall adapter, too, to recharge your batteries) when you reach your destination!

The best of both worlds...

Jared

This is true, you should have an adaptor for these cards (which can be hard to find now), they recommend the Genius Pocket LAN however there are some others that work, these are based on the same chipset as the Genius (which I think is a RTLxxxx something) but I have not tried them.

Unless you have these or can find them then they are useless to you.

1906. Atari-source Indiscretions

Newsgroup: comp.sys.atari.st
Date: 2002-08-20 22:17:53 UTC
From: Mark Duckworth <mduckworth@spaamnot.atari-source.com>
Message-ID: <1029881874.188402@pikachu.atari-source.com>
Source record: 32616
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,de.comp.sys.atari,fr.comp.sys.atari

Hello everyone,

It seems I have gone and become a hypocrite myself, and in my mission to further make a fool of myself I have screwed up. This is a personal apology to all those involved with ACS Pro, including the author, Martin Elsaesser, for my comments regarding ACS Pro. It seems as though an email that I thought I had sent to him was never even sent from my end! An article of retraction is also posted on http://atari-source.com , and is available by following this mammoth link:

http://pikachu.atari-source.com/modules.php?op=modload&name=Sections&file=index&req=viewarticle&artid=19&page=1

Again, this is a personal and public apology to Martin Elsaesser of ACS Pro fame and possibly many more people as the article is discussed and read more. The article in question is 'A Sour Taste' published a few days ago under the "Personal Notes" section of Atari-source.com.

I could only find three German phrases in Magxdesk.app: They
translate as Drive info, Folder info and File info. These were not
present in the '6.01' version. Oh, and the version/date is given
as 'vom' instead of 'of'. Hardly a problem:-)

Or did you mean magic.ram? That binary has been translated by DDP
(twice!).

Regards, /Peter/

There is no DAT attached. Does there need to be one attached for the
sample rate to lock correctly? As far as I can tell it is locking at
44,100.

Again, this is something that cannot be solved with software settings.
Problems like that are most likely caused by wrong termination and
cables. Note that there are cables that have such a bad quality that
they do not work reliably. I have such a cable at home: It's very short
and so you wouldn't expect it to cause problems, but it does.

Agreed, but I really think I can exclude bad cables and terminations in
this case.

1. Evererything wrorks perfect without the troublesome Quantum disk.

2. With the disk on the bus but powered down everything is OK.

3. If I power up the CD burner slightly later than the other units
everything works perfect too.

4. The same happens with a minimalistic setup with only the Quantum drive
and CD burner and no computer. The eject button freezes if I power
them both up at the same time.

The Etherenea (ASCI) will work with a number of ISA cards. The EHERNEC (Cartridge Port) needs RTL8019 based ISA cards, which are getting a bit rare at present, but some times show up at computer fairs and junk sales.

http://hardware.atari.org/ will get you to info on both. Lyndon has some of the required cards as well as the interface.

Dave.

1925. Is there a way I can make my FALCON and PC read the same zip disk.... (iomega type)

Hi, apologies if this is dead obvious.Only recently got a falcon and trying to figure out my way round the atari os again after 11 years away.

What it is, is that in future, I'll be getting zero-X, which is an audio program that can handle wav files. Very useful to ba able to transfer between my PC and falcon, on the same disk (and my sampler too for that matter).

Also, all the software I'm currently getting, off the net, it's a bit of a ball ache transferring it onto floppy disk to go and put it on the falcon.
Is there a way I can make both the Falcon and the PC read the same iomega zip disk so that I can bump everything onto it and transfer it over like that.

(For info purposes, I have HD Driver 8 which I'm using to format the zip disks on currently)

Thanks if anyone can offer up some pointers... RJ

>>And, unfortunately, there are some texts embedded in the binary of magxdesk,
>>and, iirc, those texts appear rather frequently in normal use.
>
>I could only find three German phrases in Magxdesk.app: They

What was meant was that there were some German phrases left in the _resource_
file of MagXDesk (Specifically in the "Options/Preferences..." menu). We'd
translated the first panel of this dialog box only.

Anyway, that gives me the chance to say that I've refreshed the MagiC 6.20
archive to include the amended resource files (applicat had some residual
German also), and the result can be downloaded from the DDP section of my web
site, URL in sig.

In the News section of the same web site you (anyone) can find a link to
download just the two resource files themselves so you don't have to grab the
whole lot again. I'll take that file down in a few weeks.

Peter, you and Dennis have been sent the two files by email.

Cheers

Derryck

Hey spork bait.

Only one thing about your post is correct. YOU are very tasteless. But then your a DELLL user so thats no surprise. "will vote with my dollars elsewhere' since the site is a fake as are you. Not that its a surprise that you never had anything with the atari label on it. You never even had the mac you've pretended to advocate.

To anyone else reading this. Within days or weeks, sinplop will recover once again from being sporked and come here drooling his usual idiocy about some fantasy homophobic "atari jihad" that exists only in his mind.

It's white, has two buttons, and has the Atari logo on it. My guess is that it belongs to an Atari ST. It has PCM1 written on the underside too.

For some reason, I have it and I want it out out out....

Mail me at riobaan@hotmail.com if interested. Name your price (highest one wins).

Case study specially for Adam: (GPL == viral infection)

1) Mr.X used GPL application - let's say WGET (mouse with viral infection)
to build his own highly successful download manager XGET (clone of infected
mouse, which is clearly infected, since genetic material was already
infected). XGET should be under GPL, or else it's a violation. This is
probably what you think of, and can't think about anything else.

2) Mr.C wrote highly successful game Q without using any GNU code (clean
mouse). He is an author of the software, and if he wishes, he is free to
release particular snapshot of Q engine source version X.X under GPL (i.e.
he cloned clean mouse and then infected it). This absolutley doesn't mean
that all derived products from original product are restricted by GPL (clean
mouse is still healfy). The only result of releasing Q version X.X source
under GNU is that anyone is free to pickup Q X.X source and do whatever
he/she wants,as long as GPL is not violated.

Still Mr.C is free to continue his developments and release major new
versions of his work (Q2, Q3, D3, Q4 etc.)

Are we clear now? ;)

GPL works like a virus in benefit of software user. But it can't criple
original author. He is still free to do whatever he wants to. But he can't
restrict GPLed product freedom, since once GPLed, it's free from any obuse
(at least teoreticly).

Ok, buy, it takes too much time

well well well, another pimplehead who has stuck his foot sideways in
his mouth and is attempting to use his mind.
here is a partial list of games/utilities that i have personaly
aquired, or pay royalties, or permission to release that have never
released to the public, and have been done in the past 7 years.
these are all for the atari 8-bit, and are on cartridge. i have some
5200 games, and even a unfinished 2600 game right from a coder who
worked at atari.
i also have a lynx game, and i am beta-testing a new game for release
on the lynx in the near futue, all of these are done from scratch
stupid.
games,
bumpers,
concentration,
jailbreak,
jigsaw puzzles,
lights out,
mahjong,
paddle wars,
puzzler,
paddle pack pong,
ricochet,
solitaire,
video slots,
video poker,
utilities,
speedo the rpm disk drive checker,
spartados 3.3c
i have more including a rpogramming cart tool for the 7800/2600.

Well, I'm not a lawyer, but it is clear to me that his new versiona should
be also GPL (as all work based on GPL code must be GPL too) and he cannot
change licensce to more restictive.

> Are we clear now? ;)

I hope so :-)

Yes, but who will ensure that the author doesn't use some pieces from
the previously GPLed and further developed mouse. No one has control
over this. You are just forced to trust the person.

BTW: This is exactly the case of UAE and Amithlon products.

regards

STan

Jared,
Your vision for the Lynx II and Jaguar II is commendible if a little optimistic, many people said that I wouldnt easily be able to make a joystick adaptor for the Jaguar that let you plug a standard ST joystick in and Fly Blue Lightning with a joystick, but a few days work and a bit of innovative engineering put paid to all the gainsayers.

It seems people are always very quick to put people down to find reasons for why something cant work rather than try and help find a way to make it work, hey its tons easier and less effort for starters!

I for one would love to see your sketches for Lynx II and Jag II I have a design for Jag II based on the fuzzy photos available of the original Jag II with CD, but with an additional Flip up 5.6" color LCD TFT screen stored above the CD Lid.

I would be happy to join any comittee of people serious about this project. Alas Im no guardian angel with massive funds available to spend on development, but Im not too shabby on ideas and problem solving.

Cheers
Chris C

Ok, so these games *are* new, relatively speaking (7 years new, if you can call something 7 years old "new", regardless of it's availability at the time or present). How many people even use a 2600 or 8-bit Atari anymore? Gonna run some awesome 2D/3D games with THOSE puppies! Ooooh! Can you say "LESS than 320x200 resolutions graphics"? I knew you could. :-) The Lynx prospect(s) are the most interesting of the bunch... got any new Jaguar titles in the making?

Jared
Modern sequels of the games that came out for those two systems would be worth more than playing games on those two systems, I think.

I think it is called nostalgia, and some people fancies that.
Do have a point somewhere, or are you just trying to be rude?

Blue Lightning was released for the Jaguar? I thought it was only a Lynx title!

I'll send you a scan as soon as I have some free time (today, hopefully)... also want to clean up the sketch. My initial draft is an absolute mess.

The Jag II LTGS would be virtually identical to the Lynx II LTGS, just more powerful (and more expensive, but... not by much, I would guess, since it would most likely use the same resolution screen, if not a more performance-bearing version of the LCD)

I think I'll be getting the Compaq LTE 486/33c laptop today... ooh, I'm excited! My plans will soon be in motion!

By the way... anyone reading this post, please go to the following link and vote! Even if you hate my guts, though, PLEASE vote honestly to your feelings about the idea itself, say, if it were posted by your best friend. I'd like to see just how many people would genuinely want what what I suggest as an idea.

http://forum.qbasicnews.com/viewtopic.php?p=5903#5903

Thanks.

Jared

> information. Note that HDDRIVER is commercial software. What's your
> registration number?

I am still in the exploring fase:

HDDRIVER 8 does not detect my IBM Travelstar 10Gb, or my CD_Writer.
AHDI 6.06 detect my 10Gb, but freezes after formatting.
IDEPCNT can read small partitions if formatted on a PC, won't write.
Metados and Spin detect my CD_Writer, but not my HD.
Extendos has not been a sucess yet.

I am not interested in bying all of these products when I am not
able to make them work. That I consider to be a waste of money.

If you wish, I can consentrate my efforts on AHDI and Metados/Spin.

There could also be hardware issues with long IDE cables.

OH I agree whole heartly. But I would like to raise an issue over what is comercially value to you the product or the name. You see HDDriver is good for allowing access to yours and mine
Hard drive. The more functions you add is better for in you value and added bonus to me. But still
it selling point is for accessing Harddrive use only. So regardless whether you obtain HDDriver 1 to
7 and beyond, I have bought the product for the purpose of access. I could quite easily hand him or her
the disk with only the necessities for access only. This is what a demo is for, too allow people to judge
and inquire or enquire. I would the first person next to Uwe Seimet in defending his product and fight
for his right to sell. In the end you have great product but you allowed the access to copy. How about
creating software on disk that cannot be copied.

regards

Hi James,

I've got MichTron BBS 3.0
The beauty of this software is that it comes with it's own programming language.
A cross between BASIC and C and comes with a compiler.
So you can customize the BBS to your own liking.

If interested, please make an offer.

Chris

Nostalgia works for me too. I can download Adventure and play it on a 2600VCS emulator. It's fun, for a short while, but real life comes back and I realize, today ain't yesteryear. I downloaded all the audio files for TCB's "Enchanted Land"... the music is just as good as it ever was, but... it's not quite as awesome/exciting as it was back then.

I am nostalgic to a point. But I'd rather have "back then", in the "here and now". Memories of the past are a poor substitute for living it *today*. And, for those that simply say "Get yourself an ST and relive the past!" That won't work. The ST and all past hardware are just that... PAST hardware.

Why do you think I am so excited about the AmigaOne? Because it's a piece of the past (at least the OS and company are) that is coming to be used/available/supported TODAY! Having my cake and eating it too... now THAT'S fun!

Adam Klobukowski (atari@gabo.pl) wrote:

: > GPL works like a virus in benefit of software user. But it can't criple
: > original author. He is still free to do whatever he wants to. But he can't
: > restrict GPLed product freedom, since once GPLed, it's free from any obuse
: > (at least teoreticly).

: But even author of software that is under GPL (as author I understnad
: intelectual rights owner) must obey GPL as a normal user.

The GPL is an agreement between the author and a user to whom they distribute the software. It only effects what the author can do with respect to each user who got the software from the author while it was GPL licensed.

The author of the software (assuming they are 100% the author) has access to the software because they own it, not because of any license, and the GPL cannot restrict the author's use of the software at all, except in how they deal with the users to whom they distributed the GPL software. If the author makes new softare based on the old then the new software is not automatically GPL'd because the author's access to the original code was not based on GPL but based on the fact they owned it.

Users to whom they first distributed the software are of course free to distribute it because that was the agreement they had with the author, and indeed those new users are also free to distribute the software (again because that's what the author agreed to), but in this case the original author does not have to supply the source code for these new distributions, that is the responsibility of which ever person distributed a copy to a user.

In particular, an author could stop distributing the software under GPL. In this case the only people who have a right to ask the author for code are the people to whom the author distributed the GPL'd code.

1962. IDE CDRom to Cartridge port

Hei All.
I was looking back at an old article in STFormat. I noticed a piece about connecting
a ide cdrom via cartridge port with the use of a gadjet. I would like know if anyone is
still using this method and is there a difference in quality by this method than SCSI way.
"Are these gadjets still around"?.

regards

jno

1964. Declaring Alt-RAM

Newsgroup: comp.sys.atari.st
Date: 2002-08-22 20:49:45 UTC
From: vdjole@EUnet.yu
Message-ID: <ak3ip6sml2@news.eunet.yu>
Source record: 32525

Hi;

I am testing a design of an Alt-RAM board in a MegaST4. Currently there are 4MB installed (8MB possible), starting at $600000. Starting address with a 2MB gap after ST-RAM was selected with the hope that TOS would not confuse this memory with ST-RAM. First tests show that the memory physically works OK, i.e. peeking and poking various bit patterns do not show any problems so far (more extensive testing is in order).

The problem is that TOS 2.06 does not seem to recognize the existence of this additional memory. I understood that one had to declare the presence of Alt-RAM by calling a certain TOS function, so I made a little program in Gfa-Basic:

```
DEFINT "s"
size=&H400000
PRINT "Install ";size/1048576;"MB Alt RAM starting from $600000"
i%=GEMDOS(20,&H600000,L:size)
PRINT "Status:",i%
```

This returns status 0 (i.e. OK) but still TOS does not show any recognition of Alt-RAM; at least a couple of "sysinfo"-like utilities say so. And programs with alt-ram flag set in the header still load into ST-ram.

Can someone suggest am I doing something wrong, software-wise? Is the Alt-RAM declaring program OK, or is there more to it? What utility would be convenient to show that Alt-RAM is recognized? Is there perhaps a tested Alt-RAM-declaring program available somewhere that I could use for memory starting at $600000 ? As I am still testing the device, I allow for the possibility that it is not yet operating quite as is should, but it looks more like it is a software issue now.

Thanx in advance.

Hi Derryck

SORRY ABOUT THE CAPITALS, EMAILER DOESN'T LIKE QUOTED TEXT IN DATABASE MODE!!?

>After purchasing an Adtron PC Card Reader earlier this year, and sorting

>out the strange case of the extra LUN associated with it, I now find that
>this third device upsets the rest of the chain!!

Sounds like a termination issue to me - does the card reader have active termination? If it's anything like the Zip drive then you have to have it switched on to activate termination.

NO IDEA! THERE IS A SELECTOR ON THE BACK OF THE ADTRON WHICH ALLOWS 7 IDS EITHER TERMINATED OR NOT. BUT THERE IS ONLY ONE SCSI PORT ON THE BACK OF IT (SCSI II CONNECTOR) THEREFORE IT MUST BE THE LAST DEVICE ON THE CHAIN! UNLESS IT IS POSSIBLE TO FIT SOME SORT OF CABLE SPLITTER WITH AN SCSI-OUT END? AND THEREFORE SOMEWHERE TO PUT AN EXTERNAL TERMINATOR, BUT I DIDN'T SEE ANYTHING LIKE THIS DOWN MY LOCAL MAPLINS STORE!?! I HAVE SET THIS SELECTOR TO 6 TERMINATED.

I'd recommend double- and triple-checking that all terminations are removed, and if possible, select external termination on that card reader and use a good quality terminator block. And at least one device should provide TERMPWR to the bus, although your Falcon should take care of that.
BUT THIS DEVICE CAN ONLY BE THE LAST IN THE CHAIN!

First though try the reader in the chain by itself and see what happens.

UNFORTUNATELY I SHALL HAVE TO PURCHASE A SCSI-II TO SCSI-II CABLE TO TRY THAT. IF IT WORKS ON ITS OWN THEN THAT'S THE ONLY WAY I'LL BE ABLE TO USE IT, UNLESS SOMEONE MAKES SOME SORT OF SPLITTER SIMILAR TO THE OLD PRINTER SWITCHBOXES??
3 Atari Systems:
Falcon 030 PowerUp2 32MHz/14Mb/1Gig/CD
Falcon 030 MkX CT2B 50MHz/78Mb/20Gig/CDRW

Hi Mark-

It would be useful if you'd specify WHAT you need help with. I don't think I'd want to spend the time typing up an entire tutorial here, and I doubt anyone else would too. That may explain the lack of responses. I've used Logic Audio many times in the past, and may be able to give a few pointers. What have you tried? What is giving problems? The audio windows and functions are very similar to the midi windows equivelants.

>
> Thanx in advance.

As far as I know this isn't possible without a good bit of hardware
modification. If it was I would be quite happy as I might be able to put 4
4 meg SIMM's in my MSTe to bring it to 16 megs. With only software
modifications, I should be able to recognize 16 megs, but even under MagiC
which is an all out TOS replacement only 4 megs are reported. I think the

ST(e) architecture limits it to only be able to address 4 megs, and how certain ram boards have gotten past this in the past is beyond me.

Anyone with some ideas on increasing the RAM of a MSTe past 4 megs, I woudl very much like to hear it.

Thanks
Mark

jared said,
Ok, so these games *are* new, relatively speaking (7 years new, if you can call something 7 years old "new", regardless of it's availability at the time or present). How many people even use a 2600 or 8-bit Atari anymore? Gonna run some awesome 2D/3D games with THOSE puppies! Ooooh! Can you say "LESS than 320x200 resolutions graphics"? I knew you could. :-) The Lynx prospect(s) are the most interesting of the bunch... got any new Jaguar titles in the making?
Jared
Modern sequels of the games that came out for those two systems would be worth more than playing games on those two systems, I think.

no what i said was that i started relelasing games 7 years ago up till today, some on that list have been released recently.
how many people use these machines still? thats a good question.
last night a fellow was on my web site and ordered one copy of each of my new in the box 2600 titles, thats a total of 104 games. you tell me how popular it is.
again please see e-bay, atari rules.
2-d,3-d who cares when you want to play atari.
the jag was, and still is a cool machine, just like the awesome falcon 030.
they to have the same feel as any other atari machine, see if you really are a atarian you will understand atari is like drugs, once your on it, its impossible to get off.
i hear that everyday from my customers who have the latest, but pacman on the 2600 still rules.

>
>What about the Termpower jumper on the Quantum ?

This Quantum Fireball SE does not have any other jumper settings than ID
and termination. I have termpower set on the main Fuijitsu disk.

I did solve the problem today in an unusual way:

I simply made a small power up delay unit so now everything is OK. The
delay is set to appr. 15 seconds and happens only at first power up. I
made it from 9 components including a transistor and two relays.

Got so excited by the result that I also made some major work on two
TT's. Switching TOS and Ajax chips, floppy and harddisk from a newer TT
with conductive paint to an older with metal schielding. Lots of work,
but now my main Atari has a working Yamaha chip and will print properly...

If you get really really desperate for SDManage there's a slight
possibility I can rescue mine.

a) Floppy is dusty.
b) Not PC readable.
c) May not be copyable (I suspect it is)
d) Haven't fired up ST in [insert random value >12] months.

Good news is the old ST is still all connected to everything else
ST'ish. This is offset somewhat by the fact it's buried. Not buried in
the ground like an old trusted motorbike you understand, but buried
under junk. It's on one of those multi-tier computer desks which sits
under sturdy shelving attached to the wall. I ran out of sturdy
shelving space and started using the desk. Then I ran out of desk and
started using the boxes placed in front of it. Then boxes got full and
more boxes got piled on top of them. Then I started not being able to
reach stuff on the sturdy shelves. Sometimes I could prod them off
with a pointy-stick. Sometimes not. Important stuff that did succumb
to pointy-stick treatment got replaced nearer the front. Less
important stuff got launched, in an airborne arc-like manner, back
onto the study shelves (often numerous times accompanied by
enthusiastic oral emissions of a vulgar nature). Sometimes they fall
off again in the middle of the night. More often they fall off soon
after and scare the sh*t out of the dog. I ought to tidy up.

Let us know. ;-)

>
> GPL states this that any work based on GPL must be GPL too, there is no
> difference who does it using what code.

Malcolm's point is that the author has more rights under copyright law
than does any recipient of the copyrighted work. IANAL, but my
impression is that the GPL isn't phrased in such a way that the author
gives up ownership or the rights granted by copyright law; the author
simply waives many of those rights. That doesn't mean they couldn't be
exercised in another contract. I don't know of any case where it's been
tested in court, but the author of a GPLed work could theoretically
stop using the GPL and distribute future updates using some other
license. Only the author can do this, though, and in practice many
GPLed works have so many authors that this won't happen; the logistics
would make it a practical impossibility.

As an example, consider Ghostscript (http://www.cs.wisc.edu/~ghost/).
It's distributed in three ways: Under the GPL, under a more restrictive
license called the Aladdin Free Public License (AFPL), and to specific
licensees under a more conventional commercial license. If what you
were saying were true, artofcode LLC (the Ghostscript developers)
wouldn't be able to get away with the commercial or AFPL distributions;
they could be sued and forced to distribute everything under the GPL
only. This has not happened. There are other examples of dual-licensed
programs, although AFAIK most use two similar open source licenses.
Nonetheless, the same principles hold true; if the GPL were really as
restricting to the author as you claim, such dual licensing would not
be possible. Perl is an example of a dual-licensed open source program.

One further caveat: Malcolmn, you, and I are from three different
countries. I'm most familiar with copyright law in the United States,
which I expect is pretty similar to Malcolm's Canadian perspective
(aside from atrocities like the DMCA). I don't know much about Polish
copyright law. It's conceivable that an author's hands would be tied
more by a license such as the GPL in Poland than in the US.

1987. A curious problem

Newsgroup: comp.sys.atari.st
Date: 2002-08-23 18:39:08 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <ak5vgc$ie5$1@thorium.cix.co.uk>
Source record: 32545

Hi!

WARNING: Long post!

I thought (some) readers might be interested in a couple of problems I've just had with unZIPping an archive and then copying one of the files:

I was sent a MIMed/ZIPped file of a beta program as an attachment. It deMIMed fine, but trying to extract the ZIP in Arcview, UNZIP540 and 2-in-1/ZIPJR failed, with a message such as:

```
Archive: K:\LUNA210B.ZIP
creating: Luna210beta4515/
checkdir error: cannot create Luna210beta4515/KUERZEL
unable to process Luna210beta4515/KUERZEL/.
checkdir error: cannot create Luna210beta4515/KUERZEL
unable to process Luna210beta4515/KUERZEL/ASSEMBLR.KRZ.
checkdir error: cannot create Luna210beta4515/KUERZEL
unable to process Luna210beta4515/KUERZEL/A_HTML.KRZ.
......
etc. for all other files. (See below *)
```

So I extracted it to a compatibly-formatted SyQuest EZ135 on my son's PC under Windows XP - twice to be sure, once from the MIM and once from the ZIP. Both worked fine. But when I transferred the EZ135 cart to my Falcon, I found I could not copy one of the files (the APP) though the rest of the files copied fine. Attempting to copy the APP caused the computer to freeze. So did an attempt to compare the two extractions in Egale and double-clicking the APP on the EZ135. I had to reboot each time to get the computer to work. This was both under MagiC/NVDI and also under plain TOS4.01.

Thinking there might be a disk fault, I first checked the disk structure with CORRECT.PRG and DISKUS and when no fault was found extracted the archive a total of 6 times to different folders on the EZ135. No joy - all behaved the same way on the Falcon.

Furthermore, I found that though I could load the file into a hex editor that loaded only one cluster at a time, such as the Harlekin Monitor and Diskus, and scroll right through to the end, attempting to load it into HexEdit, which loads the whole file at once, failed once more. So did trying to open it as a binary in Egale or Look'n See. Apparently I could open it cluster by cluster, but not all at once. It wasn't that big - under 500 kB -

and I have around 10 MB of working memory free on the 14MB Falcon.

Next I tried copying the file on the PC from its directory to the root. That worked fine on the PC. But again I couldn't copy or open it on the Atari! I was about to give up when I had one more try. I copied it from the cart to a floppy on the PC and voila! All was well!!! The Atari accepted it without problems.

I have never heard of such behaviour before. Does anyone have an explanation?

*) Later, I found that the ZIP problem on the Falcon was due to not having had LFNs enabled on the partition I was extracting to :-(Once I had swiched them on in VFATCONF, everything extracted fine and the resultant APP file worked OK and could be copied. Now I can understand why the lack of LFNs caused problems on extraction with such a looooong outer folder name. But this was the only LFN in the archive, so why on earth couldn't I copy the file?

Regards, /Peter/

>zip disks on currently)

Hi Rob!

Yes you should be able to do that. There should be no need to format the Iomega - just partition it with HDDRIVER and make sure that in 'Compatibility' the 'Windows' radio button is switched on and the 'TOS & Windows combined' checkbox is crossed. Note that this will only work with a single partition, but that shouldn't be a problem in your case.

As you may have seen earlier in c.s.a.st, I use a similar arrangement with SyQuest EZ135, using an Adaptec USB<->SCSI adapter. Originally I was going to move the drive from one machine to the other, but I managed to get a second drive cheap and now have one connected to either computer, so only need to move the carts. I see no reason why an Iomega should be different.

Regards, /Peter/

Correct. You have to declare alt-ram using Maddalt() for TOS 2.06.

> DEFINT "s"
> size=&H400000
> PRINT "Install ";size/1048576;"MB Alt RAM starting from $600000"
> i%=GEMDOS(20,&H600000,L:size)
> PRINT "Status:",i%

That looks right, provided the start address is also passed as a 32-bit
value - I am not sure what GFA does here.

>This returns status 0 (i.e. OK) but still TOS does not show any recognition
>of Alt-RAM; at least a couple of "sysinfo"-like utilities say so. And programs
>with alt-ram flag set in the header still load into ST-ram.

That depends how the sysinfo tools ask for the alt mem size - if they only
show the BIOS variable that declares the end of TT-style ALT ram, they will
still show 0.

The easiest test it to call Mxalloc() and ask explicitly for alt RAM:
gemdos(0x44, -1L, 1)
should report the size of the biggest free block in alt ram.

>convenient to show that Alt-RAM is recognized? Is there perhaps a tested
>Alt-RAM-declaring program available somewhere that I could use for memory
>starting at $600000 ? As I am still testing the device, I allow for the

The software from the MagnumST won't work, since the MagnumST RAM starts at
$00400000, and must be enabled by the driver (so that TOS does not confuse
it with ST RAM after reset).

Um - no. Adding alternate RAM is a piece of cake: attach your memory
controller to the bus, decode the new address range, make sure you generate
DTACK, and off you go. Only one call to Maddalt() is required to tell TOS
2.06 the memory is there.

>4 meg SIMM's in my MSTe to bring it to 16 megs. With only software

That would be *ST*-RAM, not alternate RAM. Yes, that is a bit more
difficult.

>Anyone with some ideas on increasing the RAM of a MSTe past 4 megs, I woudl
>very much like to hear it.

If you can get your hands on one: the MagnumSTE is a plug & play solution.

Hi All

FOUND SOME MORE!

HANDS ON MIDI utilities

While searching the net for Atari-MIDI programs I came across this
site which offers as FREEWARE several excellent programs and utilities
for the Atari ST. These include ON-STAGE: a MIDI file player which can
be used without monitor, a MIDI type 1 to 0 converter and a MIDI File
to pro24 Song converter.

The On Stage program looks excellent with very good graphics and
usability.

So I quickly made up a page for it and they are now on TAMW.

http://tamw.atari-users.net/hands.htm

>> [...]

>As far as I know this isn't possible without a good bit of hardware
>modification.

Well I -did- a hardware modification (it was more an add-on). As said above,
physically this new memory seems to work OK, i.e. there are no collisions,
refresh is working, I can poke and peek there OK- it's just that TOS does
not recognize its existence.

Note that this is not "ST-RAM" but "Alternate RAM" i.e. similar to "Fast RAM"
or "TT RAM", but not (much) faster than ST-RAM.

>If it was I would be quite happy as I might be able to put 4
>4 meg SIMM's in my MSTe to bring it to 16 megs.
>[...]
>I think the ST(e) architecture limits it to only be able to address 4 megs

Indeed, what you have tried (replacing 1MB SIMMs with 4MB SIMMs) would
not work, as the architecture limits the addressable range of "ST-RAM" to 4MB.
In fact, as far as I can see, it -is possible- (at least on a ST/MegaST) to
extend that limit but it would be needed to hack quite a lot of lines on the
motherboard (more than I liked) in order to hook-on the modifications.

>and how certain ram boards have gotten past this in the past is beyond me.

Logically, it is understandable: Additional RAM (up to 11MB possible on a
MC68000 ST/STe) is "Alternate RAM" and it can be used to load and run
programs, but video and DMA can not access it. It should be located in the
unused address space above ST-RAM. The add-on board must provide its own
address decoding, data acknowledge and, if DRAMs are used (as would most
often be the case), its own DRAM control (row/column address strobe sequencing,
address multiplexing, etc.)

>Anyone with some ideas on increasing the RAM of a MSTe past 4 megs, I would
>very much like to hear it.

Well, If this device of mine starts to work properly, you may hear more about it soon.

2005. New on TAMW : DX7 page updated

Newsgroup: comp.sys.atari.st
Date: 2002-08-25 07:51:36 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0208242351.4af6248c@posting.google.com>
Source record: 32465

Hi All

Just updated my DX7 page some more!
I now have a good collection of DX7 sounds and (Atari) programs with screen shots as well as Tips.

Stichen ST also just sent me an excellent program called DXEdit. So it is now there. This also has a huge collection of sounds that are NOT on the usual PD dx7 sounds repritore. Great sounds! (However, they are NOT in standard Sysex format...perhaps I will do a project and convert them someday soon)I have also added more screen shots which include the TX816 editor (DXed) and Martin's YS editors. Take a look.

http://tamw.atari-users.net/dx7.htm

Comments welcome.

I believe GFA will use 16 bit words if you don't tell it otherwise. So
the 4th line should read:

i%=GEMDOS(20,L:&H600000,L:size)

I apologize if this isn't the correct forum for this kind of posting. I don't really deal much with Atari computers but have an Atari 520 ST Keyboard, SF 354 floppy drive, an Atari SC1224 Video monitor and a couple of manuals. I'm looking to get rid of. Unfortunately I don't have cables for this stuff, its all untested, but is very clean.

Looking for $15 plus shipping (or pick it up to save some cash). I can ship Fedex ground, which is usually reasonable (still figure $20-$25) for shipping depending on your location.

Hopefully someone can take this off my hands.
Thanks,
Anthony

HI all,

Has anyone tried running the ST DMA controller at 16mhz to see if HD access doubles ? I can find little info on the IC so I am not sure if it can run at 16mhz. AFAIK I dont think there will be any problems if it can clock to 16mhz. probably the CPU will spend double time on it but thats the whole idea really ?!?!

Thanks,
Chris

Apple's website offers all the OSes up to 7.5.5 free to download. You'll have to search it on the site as I forget where exactly it is. I believe that Spectre can only use OS 6.x.x.

Kenneth is correct. The missing L:'s is important here.
Might as well define size as a long too.

Is taken care of by:

DEFINT "s"

But you are right, imho it's quite dangerous not to use the %-sign
everywhere as it is very easy to do a misstake somewhere that can be hard
to find later on.

I didn't even see the DEFINT line. ;o) I personally never use those global DEFxxx commands. I seen the i% and assumed he was using specific var types. Hopefully it's working now for him.

Alfredo,

I've got a complete GCR setup, including some Mac software, manuals, and miscellaneous books I'm planning on selling on Ebay. It includes an external 720k flopply disk drive for those who might not want to set up a partition on their hard drive for GCR. I don't plan on parting it out, I want to sell it as a package.

Drop me an email if you are interested.

I'm in the United States.

Lets see, in the past year you've claimed to live in Deluth (no not a vacation you claimed to LIVE there), Iowa, Idaho and
as you put it "300 miles south of china", so which is it? You've also claimed to work for compusa, now you deny it. Also
you claimed to work for various mac dealerships as an "apple power rep" despite the fact you know nothing of apple and no
apple dealer will admit that you work there.

What does this mean? your still an out and out liar. No surprise there.

Hi exxos

> Has anyone tried running the ST DMA controller at 16mhz to see if HD access
> doubles ? I can find little info on the IC so I am not sure if it can run at
> 16mhz. AFAIK I dont think there will be any problems if it can clock to
> 16mhz. probably the CPU will spend double time on it but thats the whole
> idea really ?!?!

I believe this will fail miserably, the last time I looked into the DMA system I found that timing is very critical, there are even a bunch of "nop's" in the DMA code's timing loops to make sure its spot on.

After using E-tool something weird happened: all
the collected messages in the CSAST are replaed
by ones that start with strange signs and cannot
be opened anymore. Which is not the worst: they
cannot be deleted either...Has somebody a cure
for this?

Raoul Teulings
3 x TT, 1 x Falcon, 2 x 1040 ST, 2 x Stacy, 1 x STBook, 2 x Portfolio, 1 x Jaguar, 1 x Lynx.

Steve,

Why else do you think that loser has lied so many times about his place of residance and employment over the years? Besides the fact that he dont want anyone knowing he works as a night janitor
at a gas station & 7/11 and lives in his mothers basement.

Yours is the first post in any newsgroup ever with the words "etool" and "Atari"! So maybe all others who tried this tool messed up there newsreaders so hard they could never post a question how to fix the problem. Consider yourself lucky! :-)

Seriously, what on earth is an "e-tool"?

Hi Joseph! Sorry it has taken me awhile to respond to your message.
I've learned quite a bit about the things you've mentioned, and will
be happy to help, although I'm a bit busy right now. My Falcon is at
my home studio, so I'll look at the mixer maps and get back to you
about setting them up properly. I know that each controller in the
mixer map must be assigned properly to have any affect on the recorded
track. More later! :-)

Just in case anyone else is interested in the GTS-100 power, it seems
that my Atari power supply has been modified for the GTS-100. A
multimeter reading on it gave a 14.8 VDC reading... not the 9.3VDC
posted above!

You have got that wrong! Three TT:s is just what you need! That's what I
have here too.

The STBook on the other hand could be disposed of. If it takes up too
much space in your room you might think of selling it cheap to me. I have
plenty of room for several STBooks here :-) :-)

I might want one of those mysterious E-tools as well, who knows :-)

Is that right!, he really actually sleeps with his mother, are they also having un-natural relations, your post didn't make that too clear?, could you elucidate a bit on that statement about the farm animals, I'm not sure what you mean by "pushing pig's", and you surely cant be saying that he really stalks cub scout packs because he's a thing about young boys in uniform.

Pray tell in more detail.

Thats not unusual, thats the unloaded measurement. if you plugged the drive into the power with the case off and the power switch on and
measured voltage you'd see a noticeable drop.

2051. New Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2002-08-28 10:46:27 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <2002828-114627-385153@foorum.com>
Source record: 32310

Hi,

I just have placed on my homepage a new release of Eureka.
This program is shareware, a "2D Graph Describer,
and 3D Modeller". This software is released nearly every
month and made tremendous progresses since 1996, for its
first release on the WEB. I would like to thank every
people that helped for it. You will find on my homepage
the common version for every ATARI. But, if you want a more
specific version, I suggest you the following links :

http://eureka.atari.org/eurka209.zip
That is the Complete Common Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Is Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny043.zip
Is the Open/Gl Extension (requires previous package)

I wish you big fun with all this STuff.

Regards,

2052. Re: MagicMac 6.2 upgrade problems

Newsgroup: comp.sys.atari.st
Date: 2002-08-28 13:31:40 UTC
From: Dennis Vermeire <dennis.vermeire@gmx.net>
Message-ID: <1030561540-35743AEicMi@gmx.net>
Source record: 32311

From: Bill F <nobody@nowhere.com.invalid>
Date: Thu, 22 Aug 2002 17:42:39 GMT

Hi Bill,

>Another dialog I have seen is;
>
>Can't hide the I/O-address space at $FFFxxxx on this machine.
>Programs which access this space won't run correctly.

In the tools folder of MagiCMac there's a small file which should be put in
the extensions folder of the system, check if "+MagiCMac ST-Ram" is present
in the extension folder, if not copy it in there yourself...
MagiCMac allocates memory for ST-RAM at a location that is now used by Macs
with PCI ports, the extension file relocates ST-RAM memory to a different
memory offset.
Note that 4Mb is more or less the maximum amount of ST-RAM that you can
allocate on a G3, which shouldn't be a problem really since most apps will
use TT- memory anyway.

>Ein Fehlerhat die Aktualiserung verhindert.
>Fur das Update ungultige Datei ausgewhlt.

- Update aborted due to an error

- Illegal file/data selected for the update

You need to select the "MagicMac OS" file for the update to 6.20, not the
file "MagiCMac" which is the boot/configuration program.

Cheers from Belgium
Dennis

> difference who does it using what code.

Whatever, Mister. I'm not paid to enlight you. Just think about this:

Quake 1 source code is under GPL. Quake 2 is a further development of Quake 1 engine, and it's GPL. Quake 3 is an even further development of Quake 1 and 2, as well as Doom 3. Now give me source code for Quake 3 and Doom3. Do you think Carmark violates GPL?

Anyway, this discussion doesn't make sence, since you don't listen.

2059. MP3 Licensing Fees

Newsgroup: comp.sys.atari.st
Date: 2002-08-29 06:28:03 UTC
From: Mark Duckworth <mduckworth@spaamnot.atari-source.com>
Message-ID: <1030602483.563324@pikachu.atari-source.com>
Source record: 32317

Hello everyone,

With the advent of the new licensing fees, chances are the ability to play m3p will probably have to be removed from aniplayer and falcamp. This doesn't matter much to me as I personally use Ogg vorbis - a vastly superior format, which is even more superior for low bitrate recordings. I can hear BIG differences between Ogg vorbis at quality 5 versus mp3 at 128kbit. So what I suggest is this: DSP decoder routines for ogg vorbis for falcamp and aniplayer. What do the authors think? Is vorbis audio more difficult to decode such that a standard falcon might not be able to do it?

DMA and many other pieces in the ST are synchronous, ie you can feed it a new clock and everything is OK. Best is to replace the 32MHz crystal and use a mulitsync monitor. I've used 64Mhz though I didn't leave it for more than five minutes. Also there are things to change, bus drivers to 'F' ones and possibly stronger pullups on the buses.

I usually get the runtime error when I'm at at website and try to go
to another page on the site.(the error does not occur right away).
I'm using the latest ovl from Dan Baldrick.

I usually boot in Mint when I plan to visit https:// (secure
sites).When I just plan to surf for fun I use plain old tos.The
runtime error seems to happen under tos.

I erased the files that were no longer used I then used hpopt to
optimize the disk.So far I haven't seen the runtime error lately.

Sorry about the late reply

That's the basic fix to it. I never quite figured out why this occured.
But for me after awhile, I need
to clear out the cache or CAB just becomes unstable.

don't doing that speed up the sound aswell ? its hard to keep track what is run from the 32mhz clock. If it was done right I guess just the MMU and CPU could double in speed and keep everything else at its correct speed, though in doing that things might be out of sync between the 8mhz bus and the 16mhz bus, its hard to follow a bit :(I have seen the CPU boosted with /AS , I asume that it runs at 8mhz when accessing some thigns such as video, and other times it boosts it to 16. its supposed to give a 25% increase though that seems a bit pointless really. There should be away to keep the RAM and CPU at 16 without upsetting everything else in the process.

Hi Ed,
I've been told to suggest French software from r&#65533;mi Vanel for FLI.

I noticed at a online computer cable dealer that they have a Y adaptor for the serial port (which would give you two serial ports instead of one).If I hooked up this Y Adaptor to my Falcon serial port would I be able with Genmouse use both my modem and a serial (pc) mouse

Thank You

Nope. The serial port can only talk to one device at a time.
One or the other, but no both. You need more than one physical serial
port, like a TT or such has.

I am still having a very hard time finding any resources for help with CAF, so I appreciate the help I get here very much.

When mixing down audio (permanent mixdown), nothing is being written to the new track after measure seven on the locator, although the transports continue to move, and there is material to be recorded. I can't find any reason for this, but it happens every time. It's like it is automatically punching out at measure seven, although punch out is not selected. Please help!

>
I can't remember this ....
X_Alyser was great at showing waves in 2D and 3D formats with a lot of
options which Synthworks didn't support ......
Also be aware that the X_Alyser format is supported by SoundDiver of
Emagic on Mac and PC, so all your work is not lost if you cross to
another platform like me.
It's great but quite normal .... wasn't CLAB the old Emagic ?
Must I add that Emagic was just bought by Apple ?

Maybe X-Alyzer was written for the first edition of the DX7, and was not updated to work with the extented performance features of the DX7II ?

That could explain some things. The old DX7 didn't store some performance settings for each patch, the DX7II does. When sending old style DX7 data (without performance settings) to a DX7II, the DX7II falls back on default settings ? I'm just doing an educated guess now, I don't have any DX7.

Martin Tarenskeen

2090. Re: MagicMac 6.2 upgrade problems

Newsgroup: comp.sys.atari.st
Date: 2002-08-31 15:52:52 UTC
From: Dennis Vermeire <dennis.vermeire@gmx.net>
Message-ID: <1030895700-36180AEicMi@gmx.net>
Source record: 32376

From: Bill F <nobody@nowhere.com.invalid>
Date: Wed, 28 Aug 2002 22:40:43 GMT

Hi Bill,

>I sent a detailed email to System Solutions describing my futile
>efforts at upgrading to 6.2, with screenshots of the German dialog
>boxes I was seeing. El Fernandez wrote back and said the 6.2 update
>won't work on the English version 6.1.5. He said it only updates the
>German version 6.1.5.

The 6.20 updater replaces the following files:
MAGXDESK.APP, MGEDIT.APP, MOD_APP.TTP, MOD_APP.TXT, VT52.PRG and VT52.RSC,
these files are placed in the GEMSYS/GEMDESK folder on partition C. Note
however that except for VT52.PRG the RSC files of the other apps are *not*
updated because they remained the same and the updater assumes these to be
correct, and that's the problem IMO...
Finally the MAGICMAC OS kernel is updated to version 6.20, but since the
MAGICMAC boot/config file remains unchanged, it insists that one is using
version 6.1.4 or 6.1.5. Apps like Zbench, Kronos, Sysfile etc... will show
however that one is working with version 6.20 from 28.08.2001.

From your previous post I got the impression that the English version 6.1.5
consists of nothing more then just the translated kernel? When version 6.1.0
was released most of the apps and files in the GEMSYS/GEMDESK folder were
updated along with some SLB's in the EXTENSION folder and a couple of files
in the AUTO folder... if these are missing or are still at MagiCMac 6.01
level like I assume, then yes, it won't be possible to update to version
6.20

>When I am running version 6.15 and I open the "about MagiC" box it says
>"V06.01 vom 18.07.1998. Even after running the 6.2 upgrade, the file
>in the root directory named MagiCMac with a file size of 244 K is still
>reported by the Macintosh OS as unchanged and as version 6.1.5. I
>don't think the updater is really updating this file.

The "about MagiC" box refers to the actual version of MagxDesk, to find out
quickly what kernal is running check the MagicMac configuration CPX, but it
seems to me that you've received a "souped up" version from System Solutions.
The file MagiCMac should have a file size of 251.687 bytes (version 6.1.5)
and the MagiCMac OS file should be 222.832 bytes (version 6.1.5), once it's
been updated it should be 224.657 bytes long.

>I can live with 6.1.5 but I sure would be nice if there was a little bit of
>information about this on the ASH web site, in English. It was very
>frustrating.

We'll sort out this mess in no time, get in touch with me via personal mail, I've got all the missing (English translated) files right here.
But it's not ASH who's obliged to put info about the English version(s) on their website. System Solutions/Atari Workshop is the official distributor, all info and updates should be on their website. I realise that this is not easy to grasp but ASH hasn't got anything to do with the English versions at all.
MagiCMac 6.20 has been around for almost a year now, it's about time that El Fernandez sorts this out. MagiC Atari and MagiC PC users still have to work with the outdated version 6.01. Not to mention some of the other ASH titles for which an English update is long overdue...
I.e: Scripter, Texel, Emailer, Artworx etc.

BTW: I've nearly finished translating the MagiCMac configuration/boot file, it should work with versions 6.1.4, 6.1.5 and 6.2 .There's still a lot of German left in the MagiCMac OS file, but for obvious copyright reasons DDP can't release a patch/translation for that file... :-/
Everyone who bought MagiCMac from SystemSolutions/Atari Workshop should get in touch with them and DEMAND a fully working 6.20 update/full version. In the mean time the translated MagiCMac configuration file used together with the English Magxdesk 6.2 files will more or less bridge the gap. The file(s) will be put online when Derryck is back from his well deserved break....
watch this space.

Cheers from Belgium
Dennis

Source record: 32375

From: Raoul Teulings <rt@xs4all.nl>
Date: Mon, 26 Aug 2002 22:04:22 +0200

Hi Raoul,

>After using E-tool something weird happened: all the collected messages in
>the CSAST are replaed by ones that start with strange signs and cannot be
>opened anymore.

E-Tool is ment to alphabetically sort the folders of the "Sorted" posts
section of ASH Emailer. It's not ment to sort newsgroups...

The order of the newsgroups is determined by their designated number:
1.grp
2.grp
3.grp etc....
Each file holds the name of the newsgroup, so if for example CSAST is shown
as the third one and you would like it to be displayed on top as the first
one, you'll have to rename file 3.grp and 3.idx to respectively 1.grp and
1.idx. The *.idx files keep track of the last posts you downloaded, if it's
not present, ASH Emailer will attempt to download all the posts that are
available on the server.

Note, that when using Emailer in database mode you *must* revert back to
single message mode first, failing to do this will result in all the posts
being sorted in wrong groups, and some will contain a lot of gibberish
characters.

>Which is not the worst: they cannot be deleted either...Has somebody a cure
>for this?

Yep :-)
Revert back to single message mode, and deleting them shouldn't be a problem
anymore, note that when in single message mode all posts are stored in their
respective folders as ASCII files, so you can delete them from there as well,
if you're in doubt which one to delete, then use "Show File" in the "Message"
menu.

Cheers from Belgium
Dennis

Here, here. I'm an Amiga freak and an Atari freak and I feel like I'm living in an episode of Sliders (awesome show) where the absolute worst platform took off and the really great computers have been forgotten. I have 3 Ataris with '030s in them, the games are great, the utils are fine and they don't crash and give you a blue screen of death. Gotta give props to the most stable systems ever made.

Amiga/Atari forever! Or think of it this way... a good friend of mine said "computers are cool."

Hi,
does anybody know the author of the software part of the Janus
Emulator (the old distributor couldn't help me) ?

Thanks Bernd

2096. Atari ST with '030 FS

Newsgroup: comp.sys.atari.st

Hi "Edward S. Baiz Jr.

>I have no problem with the company, however I question the motive of
someone >who cannot abide by simple rules. Most peop's manage to advertise
in here with >a few lines on a sig, that I think is cool, it lets peop's
know they are about without >filling my Inbox!!.

While I appreciate your anti spam sentiments...
If people would not gripe at the ads, and keep them going as long flame
threads,
they would stop filling your inbox as much. I usually see one of these ads
a month or so, with dozens of CRAP responding to it...thus multiplying the
spam times 10. Just set your software to ignore it of ya don't like
it...and by all means, don't make the thread LONGER with flames.

I can see your point about the long ads...
Then again, I can see Bravo's as well.

Why don't we discuss cool Atari things instead of building whiney threads
like this.
I'm outta this thread now, for good.

Happy livin' to all!
Brian

> punching out at measure seven, although punch out is not selected. Please
> help!

Hmmm, if punch isn't somehow activated...double check:
1. In audio settings: that you are writing to disk rather than RAM.
2. That you've enough space for the track on the drive.
3. That you haven't accidentally put any mute commands in any tracks
somewhere.
4. That everything you want to do is on seperate channels...it's easy to
mistakenly set things up so that a couple of audio tracks are trying to use
the same channel at once...you can't do this with predictable results.

I.E. When you select "any" to make or play back a stereo track it goes to
channels 1 and 2 by default. Later, you might try to record another stereo
track...it's gonna go to channel 1 and 2 by default as well...so...you'll
need to move one or the other to unused channels if you intend to ever use
them at the same time. To do this...double click the sequence bar in the
arrange window and you'll get another window with enlarged views of the wave
data, and you'll see along the left edge of the screen what channels it will
use to play back. Drag it beside channels you know are free. If you run
out of channels for a mix down you really wanna do...well...you'll just have
to start bouncing some things down to fewer tracks and make room.

Some tips...
I find it's the least confusing to always try to keep channels 1 and 2 open
for recording things or mixing down. As soon as I've made a sample or
track, I move it ASAP to a known free channel.

I like to make one track called 'master sketch' that is set to 'channel
any'. As soon as I've made new tracks, I mute them...then I double click
the master sketch and paste a copy of it there, where it goes in the music,
on a track that's not being used at that point in the mix...this way I can
easily SEE ALL of my samples, any overlaps, triggers, raw volume settings,
possible channel conflicts, etc...right there in one place. Since I always
keep channels one and 2 open in this fashion...I'm at leisure to record or
mix down to tracks 1 and 2 without much thought, or fear of 'forgetting'

what all I've put where'. I do 99% of my track placements there in that one track "Master Sketch"...it's a great picture of what's happening when ;)

Number 4 is the most common/likely problem.
Maybe you've a sample on bar 7 with a channel conflict?

Hi, Hallvard,

Hallvard Tangeraas wrote:

> True, but there's a better chance to find someone involved in MIDI in a
> MIDI related newsgroup :-)

Unless the lurker knows about Atari's MIDI abilities. If you're selling something, why skip any possible markets.

FWIW, it's always been one of "knocks" against Ebay, you can't post the same auction in more than one category. Thus, you can't post an Atari anything for sale in both computers and vintage computers at the same time. :-(

Unless that's changed recently.

> PS: something strange happened when I tried to post this message. It
> appears you've set a followup to
> "news://news.frii.com/comp.sys.atari.st/62976" which of course isn't a
> valid newsgroup name, but a URL it seems, so I changed it to
> "comp.sys.atari.st" and will hopefully be posted.

I've been using Opera for my web browser. Can't say the online helpfile is particularly helpful. I've been having problems uploading a graphic in another group, so I've been experimenting on what happens when different fields are filled in. This browser's newsgroup reader has a follow-up field, and I put that info in there. I don't know what it's supposed to do. :-)

Anyway, this posting is done using Netscape 6.2.3, and it also has a follow up to option. FYI for you and others, NS's help files at least give you some help here. And I quote: " * Followup-To: For redirecting a newsgroup posting, so that subsequent replies go directly to the redirected newsgroup instead of the original newsgroup."

Now that I've found an answer, I see I have no use for that feature! LOL

Hi,

> don't doing that speed up the sound aswell ?

Yes, though if you clock the YM slower it may help, and you may need
to clock MFP slower. I haven't experimented enough, but sound did go
quicker. I need to try feeding the YM 2MHz as it always has, remember
to feed 500Khz to ACIA as well otherwise keyboard/midi won't work.
The /AS works so that when the CPU is accessing the motherboard it
gets clocked as usuall, but other times, doing maths, calculations etc
it's at 16MHz. You'll notice 200% in integer tests but mosts
computers don't spend all the time doing sums. A lot of time is used
accessing RAM. If you combined that 16Mhz hack with a alternate RAM
controller, and maybe speed system to 50Mhz as well it'll go fast. I
haven't had time recently, it's getting there though.

>Edward S. Baiz Jr.
> (Gamer)

Hi Edward,

I've had a read of the info on Assemsoft and Lonny' article. Good work
guys.

I've also found out that my isp's ADSL provides a fixed IP address so I
think I can live without a gateway. Is that the same as a router ?

If I get that far I will then think about a firewall or is that not
a necessity when people only know how to hack peecee's ? ;-)

I have been trying again to get Mintnet installed on my GEM only Mint
set-up but so far no luck, I can't even get a shell running inside TOSWin2

Does anybody use the RTL8139 driver with STiNG ? I'd be interested
in knowing if it works.

I've had a look for some of the PCI cards and managed to find a D-Link
DFE-530TX (not the +) on Amazon.co.uk (convenient). I will have a look
for some of the others.

Regards,

Peter

I only ran the CPU at 12mhz, I dont think the 8mhz CPU would go any faster
than that. I'm going to have a bash at it. I dont know enough about CPU's
to build a RAM controller, I will try to double the MMU up as well. I dont
know if it will like being clocked at double speed, even the RAM for that
matter, though since it ran at 24mhz instead of 16mhz MMU clock its might be
possible to boost that to a round 32mhz. I dont know if anyone has tried
that though as far as I can tell only the CPU hack to part 16mhz has been
done. running the MMU with double clock mgiht work, though its gonna be
pushing it a bit I think.

I've sold items on ebay, it let's you place an item in 2 categories.
It did last time I used it anyway. ;-)

> superior format, which is even more superior for low bitrate recordings. I
> can hear BIG differences between Ogg vorbis at quality 5 versus mp3 at
> 128kbit. So what I suggest is this: DSP decoder routines for ogg vorbis

Some peoples said than MP3 192 kbit/s (or high bitrate) seems better
than ogg vorbis with the same bitrate.

Today I don't know if it's posible to create DSP routine for ogg vorbis,
because this format seems 10 x more complex than MP3. Another problem is
the size with the DSP memory.
But I think create a VORBIS_ENC.SLB (the encoder) for the next version.
Since some versions, a VORBIS.SLB exist for play this file on a fast FPU
machine (68060, or now Aranym ?).

Regards,

Didier.

Atari ST, 1 Mb, Arie Nagel (Eindhoven, Netherlands), Euro 15

Also: need a newer TOS.IMG (software) for emulation of the Atari on my PC
I have now on disk the first TOS (1985)
I don't think it is illegal (any more) to copy this, because Atari's are not
produced anymore, or?

>Linux would all work for me.

Under Linux, mounting the image as a loop-back device works with
standard, and non-standard, image sizes. Here's the command I used:

mount /home/davjam/languag5.st /mnt -t msdos -o loop=/dev/loop3,blocksize=512

You could use "-t vfat" instead of "-t msdos" if you're wanting to keep
LFNs.

It was not much promoted by Atari and of course too expensive for
regular users. But about 1000 units have been sold in Europe (and I own
one of them... *g* ...bought it for 145 EUR from a privat person)

Greetings, Werner

How about SRAM?
SRAM has become very cheap and is very easy to connect. No ramcontroller
would be needed (except for address decoding) and it can run very fast.
(I have lots of 1024kbit (128k) 15ns SRAMs if you want some. They are in SOJ
package (SMD) so you'll need to etch something)

Regards

/Peter

> One or the other, but no both. You need more than one physical serial
> port, like a TT or such has.

There is a hack to add another ST-compatible serialport.
(The RX/TX pins on the MFP is not used on the Falcon. These are connected to
a serialport on the ST.)

OK, now TOS 2.06 recognizes the alt-ram board, and a couple of utilities
and applications which can show this information now do so correctly.
Mxalloc returns memory size coorectly. All the tests of writing and reading
directly to alt-ram memory locations finish correctly.

However, I am still having problems trying to load and run a program from
alt-ram. When the appropriate flags are set in the program header, trying
to load it into alt-ram results in some strange errors, like "data on the
disk may be corrupted", or a bus error (two bombs) for some weird addresses
e.g. between the st-ram and alt-ram, or above alt-ram.

Am I still missing something essential? Is TOS perhaps confused after all, and trying to DMA into alt-ram? Should some TOS patch (considering the start at $600000) or driver be applied? Is there some fundamental reason which would make it desirable to move starting address to $400000 ?

Or, perhaps the board is still not working quite properly after all?

Btw. I have an impression (not very firm, though) that the errors get stranger when the blitter chip is turned ON.

This does not matter. It is still copyrighted software. If you have
bought an original Atari, you also have bought a license of TOS. So I
think, then it should be ok. For more information about TOSes, have a
look at the Aranym webpage:

http://aranym.atari.org

For a GPLed TOS clone, EmuTOS, have a look at:

http://emutos.sourceforge.net

But it is still beta software, so don't await too much. ;-)

Hi,

Beyond your GFA code what you are doing is beyond me, but on my TT
it always installs this cookie:

_FRB This cookie is present when alternative RAM is present. It points
to a 64k buffer that may be used by DMA device drivers to transfer
memory between alternative RAM and ST RAM for DMA operations.

I do not know the details of 2.06, is it fastram aware? I thought perhaps
it might be useful information to you, or possibly a clue. You could try
creating this cookie with the buffer as specified and see if the HD errors
stop. I'm guessing here, but if your HD driver sees this buffer perhaps it
uses it.

>E-Tool is ment to alphabetically sort the folders of the "Sorted" posts
>section of ASH Emailer. It's not ment to sort newsgroups...

That's absolutely right.

>The order of the newsgroups is determined by their designated number:
>1.grp
>2.grp
>3.grp etc....
>Each file holds the name of the newsgroup, so if for example CSAST is shown
>as the third one and you would like it to be displayed on top as the first
>one, you'll have to rename file 3.grp and 3.idx to respectively 1.grp and

Right, but I just used Dirsort to move the *.grp files into the order that I
wanted them to be listed (thanks to Steve Sweet for this tip).

>1.idx. The *.idx files keep track of the last posts you downloaded, if it's
>not present, ASH Emailer will attempt to download all the posts that are
>available on the server.

Of course you can limit the number of messages downloaded from the "Internet..."
dialog box.

>Note, that when using Emailer in database mode you *must* revert back to
>single message mode first, failing to do this will result in all the posts
>being sorted in wrong groups, and some will contain a lot of gibberish
>characters.

That's very odd, as I've just applied the utility to a backup of my Emailer
folder, in Database mode, and it works just fine!

>>Which is not the worst: they cannot be deleted either...Has somebody a cure
>>for this?
>
>Yep :-)
>Revert back to single message mode, and deleting them shouldn't be a problem

>anymore, note that when in single message mode all posts are stored in their
>respective folders as ASCII files, so you can delete them from there as well,

I had loads of problems with Emailer until I gave it a large partition to play
with FWIW.

Cheers

>How about SRAM? SRAM has become very cheap

Well, not sufficiently cheap... and not sufficiently dense. they are still a lot more expensive than DRAM modules. I think 1Mbit SRAM chips would be about 5 EUR (at least around here) so it would not be insignificant for, say, 8MB (i.e. 64 chips)- and the space required would be rather large.

>and is very easy to connect. No ramcontroller

That is true.

>(I have lots of 1024kbit (128k) 15ns SRAMs if you want some. They are in SOJ
>package (SMD) so you'll need to etch something)

Possibly from caches on old PC-boards? That might indeed be a very cheap way to get RAMs for a static-RAM bank. Such SRAMs can be rather power-hungry, though, being bult for speed- I measured a couple of 512kbit chips once, they pulled about 3mA each when not selected and (IIRC) about 50mA when selected. Packing 60 or so additional SRAM chips in an Atari might be too much for its power supply, even though only two SRAMs would be selected at any time.
On the other hand, DRAMs are power-hungry too.

I think now may be a good time to incorporate MP3 support via a plug-in type of system whereby people would be required to remove and cease using the plug-in when licensing is required.

You at an appropriate time would then stop distributing the MP3 plug-in whilst still supporting the system for other plug-in. 6~)

Of course people who continue to use an MP3 plug-in with future releases of Aniplayer would have to be warned its continued use is illegal. 6~)

After the latest change in the MP3 licensing terms (no more free license
for MP3 softwares distributed as freeware), Sun Microsystems decided to
drop the MP3 support from its Java Media Framework.

Sun Microsystems drops MP3 support:
<http://java.sun.com/products/java-media/jmf/index.html>

Citation:

"
JMF 2.1.1b Available, 29-Aug-02:
JMF 2.1.1b is now available for download. This release fixes a few
critical bugs [...] and removes the MP3 encoder and decoder. If and when
licensing issues can be resolved, we plan to return MP3 functionality
back to JMF.
"

Still too small/too expensive.

And unnecessary: 60ns EDO DRAM is just fast enough for a 68000 running at
36MHz, as seen on

Oops - I forgot that, you need to install a _FRB cookie that points to a 64k
buffer in ST-RAM, which is then used by TOS to xcopy data to/from alternate
RAM.

BTW: the blitter is on the CPU bus and not on the DRAM bus like the DMA, so
the blitter should be able to access your alternate RAM.

2135. Falcon030 Hard Drive Problem

Newsgroup: comp.sys.atari.st
Date: 2002-09-02 14:27:25 UTC
From: Claude Bourgoin <claude@pivot.net>
Message-ID: <3d73719f_4@corp.newsgroups.com>
Source record: 32395

I just recently bought a Falcon030 at an ebay auction. The problem is the Falcon030 cannot read from the harddrive after about 45 minutes to an hour. I then turn the compter off for about a half hour then turn it back on and the hard drive again can be accessed. I have an internal Conner 84MB CP2084R hard drive. I was wondering if any one out there has had a similar problem and how they solved it. Is this a hard drive issue or a power supply problem?

Thanks for all and any help.

Claude Bourgoin

2136. Re: MP3 Licensing Fees

Newsgroup: comp.sys.atari.st
Date: 2002-09-02 15:51:33 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <OJLc9.46510$vY2.1122149@e3500-atl2.usenetserver.com>
Source record: 32396

No, it's not illegal to distribute free code that PLAYS or READS ANY format at all. the royalties only kick if the software WRITES/ENCODES a particular file format. I.E. You can give away a program all day long for free that displays GIF, Adobe PDF, and such files.

Perhaps the owners of MP3 are trying to pull something that they 'might' win on down the road. However, at this time, it is my understanding that they can't charge you for READING/PLAYING MP3 files. It's highly unethical to tout a format as opensource and free for nearly 10 years, and after everyone and his brother has put it into software, start trying to collect fees. EVEN if the laws do work out in favor of the MP3 utility patent owners, it will only apply to code written AFTER a certian date.

If the MP3 people bully you to pay fees for something you wrote 2 years ago, when the format was FREE, then it's time for the world to boycot their stinking format anyway. That's clearly unethical, and in the past, it as been illegal to build markets in such a fashion!

Should they decide to launch new formats that aren't free, or possibly collect fees for software that WRITES/Encodes mp3 that is compiled AFTER a certian official date, then it's a little more reasonable.

Discussion?

Brian

Does the Magnum actually run at 36mhz ? its hard to make out but the CPU
looks like a 16mhz one ? Does this also support over 4meg ram ? It would be
interesting to build a good CPU/RAM booster though I dont have a GAL
programmer so can't really build it to test it out. Would be interesting to
find a better ram controller to replace the MMU.

> GIF, Adobe PDF, and such files.

This isn't the way software patents work.
The patent owner can ask you to pay if you use the patented technology
(for example: MP3) in your software.

As written in the mp3 patent licensing terms (see:
http://www.mp3licensing.com/royalty/index.html) even authors who
released a software mp3 decoder (that is to say: a player) must pay a
$0.75 fee per copy of their software (with a minimal annual payment of
$15,000).

What happened recently is that the mp3 patent holders have removed the
following sentence from the licensing terms:
"No license fee is expected for desktop software mp3 decoders/players
that are distributed free-of-charge via the Internet for personal use of
end-users"

(see:
http://web.archive.org/web/20000818191854/www.mp3licensing.com/royalty/s
wdec.html)

So, whatever says the PR department of Thomson, if you release a free
mp3 player you've no more the certitude that you won't be sued by the
patent holders.
What legaly counts is the licensing contract, the promises of the PR
department can't be used during a trial.

> It's highly unethical to tout a
> format as opensource and free for nearly 10 years, and after everyone and his
> brother has put it into software, start trying to collect fees.

I agree with you, such a behaviour is absolutely unfair.
But the problem doesn't rely in the patent holders but in the software
patents system itself (as we have seen with other cases as the GIF
patent, the JPEG patent, the Amazon OneClick patent...).

As economists have demonstrated, software patents don't encourage
innovation and have a dangerous effect on competition (creation of
monopolies, interoperability issues, legal uncertainty...).
That's why software and business methods patents are forbidden in the
European Union (see Art. 52(2) of the European Patent Convention).

You've here a small sheet which summarizes the way software patents
work:

Yes there is a way. You could network the two together using some hardware
that fits in the cartridge port of the TT that allow use of an ISA networking
card. Then just setup each computer and run the cable between them. There is
more to it, but that is the just of it.

Hello everyone,

Exciting moment for me, Octopus BBS with internet support has been released. Soon we should see some Atari BBS here or there that are telnet BBS's. Also Koos (the original author) has released Octopus BBS as freeware now! Octopus is now the most up-to-date, most feature filled, completely free BBS package for Atari! Users can expect regular updates now, feature requests can be submitted to me. I plan on keeping up with this for a long time. In order to get your hands on it, head over to the atari-source.com portal at http://atari-source.com.

PS: This could not be possible without the amazing generosity of the original author, and the help of several people in #atariscne on ircnet including but not limited to some random questions Mr. Pink of reservoir gods has answered ;-) Thank you!

This one does. This was a one-off prototype (as should be evident from the photo ;-)), and yes, a 68HC000-16 can be overclocked to 36MHz and runs hust fine (and even cool). The card has 8MB zero-waitstate alternate RAM (it would be able to handle 12MB when using a 16MB SIMM).

Note that a normal MagnumST will not run at much more than 8MHz - this one had the DRAM controller re-written for 36MHz operation in addition to the visible modifications.

wow 36mhz from a 16mhz! thats gotta be pushing it ;-) Would it be possible
to build the design without GALs ? IT could be a good project to build a
12meg board for the ST, the 4meg is a bit limiting ;-)) I think ive seen
the design somewhere though its near impossible to work out how the fast ram
works, but then again maybe the TT's fast ram design could be converted over
to the ST ?!?!

I believe holding down the Alt or Ctrl key when saving or closing will
do that. A menu will appear asking if you want all set to DSP.

From: xlator@cix.compulink.co.uk
Message-ID: <al2qq6$o66$1@thorium.cix.co.uk>
Source record: 32415

In message <1030898236-309330AEicMi@ntlworld.com>, derryck@.NOT~THIS~cix.co.uk said:

>A very rough guess, is it possible that the earlier truncation of the folder
>name was causing this problem?

Don't see why it should, as I only extracted the file. But I think
some of the problem was caused by a temperamental SyQuest cart. It
showed no errors when checked with correct.prg and diskus, but
some sectors took a loooong time to read.

BTW, a funny thing happened on the way to the Forum ^H^H^H^H^H
using the XFS ramdisk by Thomas Binder: I found that I coudn't
change the write protection in the Info dialog in the usual way
and so could not delete write-protected files from it. Thomas
pointed out that this particular ramdisk (which allows LFNs and
sizes itself dynamically) uses UNIX file permissions and Thing
pays regard to these in preference. A check showed that the
Attributes tag in the Info dialog was not greyed out for once,
and that if the User entry did not have write permission the file
could not be deleted. Simple, really, when you know :-)

Regards, /Peter/

You could possibly used a TT ram controller, not sure. I seem to
remember seeing a photo of a CT2 prototype and it was not much more
than a fast 030 and TT ram controller. I believe it may be possible
to adapt the CT60 to an ST if you want to. OK it costs more than a
hack and you don't get the DSP/Videl from a Falcon but it's
interestting none the least :) I think you need to change auto vector
interupts to vectored ones (6800 stuff doesn't exist on 020 and up),
maybe syncronise a little as 68030 has slighty differnet timing, as it
can do 3 clock cycle access (eg AS comes low on different state of
clock) and lastly generate a way to access the 6850 pheriphials.

>Exciting moment for me, Octopus BBS with internet support has been released.

I have fond memories of my BBS days. Set up as a node, collecting mail, messages and files was as easy as falling off a log (thanks to Steve Sweet for setting it up for me!), and the OLR LED beat the pants off some mail/news readers of today.

I still have my setup installed from sheer nostalgia.

Good luck with this project Mark.

Cheers

Derryck

2170. Possible to expand DSP ram? (Was: Re: SRAM ?)

Newsgroup: comp.sys.atari.st
Date: 2002-09-04 15:04:48 UTC
From: Peter Persson <pep@mbox306.swipnet.se>
Message-ID: <%jpd9.27431$t4.22121@nntpserver.swip.net>
Source record: 32428

Hi,

The DSP has 16 address lines. This gives an address range of 64kwords
((2^16)*3 = 196608 bytes).
In the current implementation only 32kwords are used. Is it possible to use
the unused address pin and larger ram chips (61c1024) to provide more DSP
memory (64kwords) or is this pin used for something else? Or would this be
incompatible with just about everything?

/Peter

Probably not. The glitch-free clock switching really needed the 7ns GAL,
doing even this in discrete logic might prove tempting (due to the timing
constraints).

The memory controller itself is one MACH210, which already replaces multiple
GAL chips. This could probably be done in (lots!) of discrete chips, but at
36MHz, the timing would be difficult to get right, too.

>12meg board for the ST, the 4meg is a bit limiting ;-)) I think ive seen

The MagnumST exists for years now and provides just that.

Hey smeghead, that means you can finally plug into your DELL and for the
first time in your life have something made by apple.

Btw, do you see anyone here wanting to pay hundreds for an overpriced mp3
player?, get a clue smeghead, the answer is NO. That should be clear even
to a nobrainer such as you. Now piss off back to
alt.dell.loser.fanboy.wank.wank.wank with your imaginary friend. You're not
wanted here.

That's hilarious. If slapdick spent as much time typing code as he spends
writing nonesense here, he could of authored a firewire PCI card driver ages
ago. For someome who thinks they are so smart, _it_ contribute zero.
I'm convinced _it_ is 400 pounds, and cannot leave the room, only someone
that pathetic and pissed off at the world could spend that much time in a
group completely unrelated to their own platform.

Sadly thats what the faux mac user who spends his life trying to harass atari and amiga users has come to. Reportadly he can leave his parents basement to make trips to 7/11 to buy the big bag of chips (he gets staff discount since he works the night shift there). The neighbourhood kids do routinely call him 7/11 since his mouth never closes.

Whats with the Dell thing? Don't own/use one.. Had an iPod until I
lent to bro, never saw it again...-)

The iPod is obviously selling well that may have prompted BB to get
on board.

As for the pricing, the market does not agree with your asertion. The
iPod is also a portable bus powered harddrive and is becomming more
like a pda .

I thought your SO...Chunks' has an iPod. Whats the matter, he will
not allow you to foam on it?

Also, there is a linux hack called xtunes until they were forced to
change the name..

Bet there is an Amiga hack comming soon..

Not to defend this troll, but he does have at least a small point for once.
I don't own an iPod, or any other mp3 player, but I've been thinking it
would be nice to get one, as I could put all my CD's on it and take it in
the car rather than my portable CD-player (itself at least 2 to 3 times the
size of an iPod) and a crateful of CD's. And it *would* be nice to at least
have the *option* of connecting it to my Atari (I'm all about having
options)... Just a thought.

If you can find one that uses removable media, like smart media, you probably can as long as the format on the card is ms-dos compatible. You would not need to hook the player to the Atari to load the songs, you just need a scsi card read/writer. I have one on my hades and TT, works like a dream for camera media. I don't have an mp3 player, so I cannot give advice which ones to consider.

Hi,
I have the following items for sale:
Please refer to the webpage below for pictures:
http://www.geocities.com/nmontaser/forsale/atari/atari.html

- Used Mega STE keyboard + Beetle mouse combo, $29 USD$ or best
offer
- Both keyboard and mouse are in good condition.
- Norwigian, but most keys are in Engllish (I used it for one year
and I had
no problems using it as an English keyboard)
- Brand new Mega STE keyboard, $22 USD$ or best
offer
- Norwigian, but most keys are in Engllish (I used it for one year
and I had
no problems using it as an English keyboard)
- ISA Ethernet adaptor for Hades or Medusa Best offer
- works with Mintnet, bought from Neuss 1999, never used
- Best electronics Power supply with Fan Best offer

If you want it all, make me a reasonable offer.
Shipping is extra. All prices in US$. Payment terms will be discussed
if you are interested in any of the above mentioned items.

Please contact me via email or call me at 613-277-5577

cheers,
Nima

Your imaginary friend has an ipod? so what? I dont want one, many others dont want one. It has nothing
to do with this group, much like you except that its somewhat more useful than you are which can be said
for just about anything.

hey loser,

Did you notice your once again talking to yourself here? btw, does anyone care abotu amiga machines in this group, beside jared? NO, not that it matters to you, you've never had one and know nothing of the subject.

What has linux software got to do with it? Nothing, no surprise since its another one of your
spurious emessions.

Well, you need at least 16MB of RAM to start with. Otherwise it won't boot. You also need a GFX card. It has to be a S3 Trio V64+ 2MB or similar. Also, you will need an IDE HD and a CD-ROM. Any model should work. Also get a PC AT Keyboard and serial mouse. That about does it for the basics. You can also add a Sound Blaster card, a network card and a SCSI card. I don't have details at the moment. I have several cool links at my work computer that I can post here tomorrow. If you don't feel up to the job, please sell me the board :) Take care.

As promised, here's a couple of links.

The Milan Help Site
http://www.der-ingo.de/en/milanhelp/index.html
Best Milan site on the net.

Le MILAN
http://perso.club-internet.fr/e_sei/milan5.html
Cool French Milan site.

Milan Computer
http://www.milan-computer.de./
Of course there is the official site. Most info is in the german section.

That should keep you busy. Mind you, I don't own or never owned a Milan.

Joshua.

here's some non-fiction about The iDiot Forever Known As Sinclap, ie
a number of his lies:

1) "I never said Calamus was crap". (He did. Numerous times)

2) "I was never reprimanded by cedarnet.org". (He was, in fact, in an
e-mail sent to me by the people running cedarnet.org, they conceded that
he had violated the terms of his agreement and that he was being warned
not to post inflammatory messages to comp.sys.atari.st - they also
conceded that he was a "Mac Zealot" who really needed to get a life. It
was so funny to see how TiFKAS flip-flopped on this, first he claimed
that he had "successfully refuted" the charge (if he did, then why did
he suddenly stop posting to c.s.a.s?), then he said that he was
contacted but he was simply told to be "more sensitive".

3) "I never said that Steve Jobs would "destroy Apple before he even
started" if he ever came back and that I had called him "an arrogant
bonehead" . Oh, he had! And when I called him on this when he denied he
said that, he suddenly started wibbling on and on about "mea culpa".
Fact is, the minute Jobs had ousted Gil Amelio, TiFKAS had begun
immediately applying his tongue to Jobs' boot leather like the
slathering little toady he is. Besides, TiFKAS claiming "mea culpa" on
his assessment of Jobs' ability to lead Apple (which turned out to be
totally wrong) is the same as Bill Clinton claiming "mea culpa" on
having sex with Monica Lewinsky :)

4) "I cannot reveal who employs me because my non-disclosure
agreement won't allow me to". Bull. TiFKAS had claimed numerous times
that he was an "Apple Power Rep", but real APRs have told me that there
are NO SUCH RESTRICTIONS. They also told me that if he had been an APR,

had his employers known of his abusing people by representing himself as such that he would be subject to instant dismissal!

5) "90% of all TOS applications fall over on the Milan" Fact is, TiFKAS made this statement before the Milan 040 was even released to the public. When the 040 did appear, quite the opposite was noted.

Oh, we could go on and on about this,. But then again, just this much shows just how much a pathetic clown TiFKAS has become, to the point that no one should take him seriously. He brings nothing to the party, and leaves with nothing. Indeed, it's amusing to see that, when he starts losing the argument, he starts attacking the entire country of his "enemy's" residence, telling all sorts of whoppers about their economy, political structure, etc.

Followups set....

Thanks for the links,

I dont know if the board works or not which is why I need to know what goes
in there before I test it.

2209. Atari Times Update - 9-6-2002

Newsgroup: comp.sys.atari.st
Date: 2002-09-06 17:35:34 UTC
From: "Gregory D. George" <greg@ataritimes.com>
Message-ID: <3D78E749.DB0467B3@ataritimes.com>
Source record: 32268
Cross-posted to: rec.games.video.classic,rec.games.video.atari,alt.atari-jaguar.discussion,comp.sys.atari.st,alt.games.lynx

Hey all,

Lots of stuff over at TAT since the last update! You do you check the site every few days, right?

Here's the reviews posted this past month that you may have missed!

* NEW! SuperCharged Frogger review
* NEW! Zaxxon 2600 review
* NEW! Keystone Kapers 2600 review
* NEW! Cosmic Commuter 2600 review
* NEW! Frontline 2600 review
* NEW! Jungle Hunt 2600 review
* NEW! Defender 2600 review
* NEW! Mousetrap 2600 review
* NEW! Pirates of the Barbary Coast 8-bit/ST review

Here are some other articles from the past month that you may have missed!

* NEW! Java games to play!
* NEW! Vote for the Top 20 Atari Games of all time.
* NEW! Garfield on Atari

Work will begin soon on the next "Year End Issue" for The Atari Times, which has a planned release in late November 2002. The "2001 Year End Issue" was 100 pages filled with Atari stories, was well received, and sold dozens of copies!

If you are interested in purchasing an advertisement in the 2002 YEI, (which will get you a FREE copy of the issue for a full-page ad), please contact me at greg@ataritimes.com !

2211. Using E-Tool

Newsgroup: comp.sys.atari.st
Date: 2002-09-06 18:44:14 UTC
From: Raoul Teulings <rt@xs4all.nl>
Message-ID: <1031346372-785675AEicMi@xs4all.nl>
Source record: 32273

Just today I found the time to get into my
problem with Emailer after using E-Tool. I do not
know if there's a connection and I am not
implying that but I found a corrupted GRPLIST.TXT
file which caused all the problems...

I switched it with the backupped one and now
everything is working like it should be...

I am only curious how the file got corrupted: a
lot of characters just got in place of the
regular addresses...It looks like if something
got imported by this list...

2212. Re: Possible to expand DSP ram? (Was: Re: SRAM ?)

Newsgroup: comp.sys.atari.st
Date: 2002-09-06 19:10:04 UTC
From: lyndonamsdon@hotmail.com
Message-ID: <1a7d6495.0209061110.5ca3d8b@posting.google.com>
Source record: 32270

Hi,

I think DSP can only take 15 address lines. Most people compalin from the speed it takes to get data from SRAM to system memory I think. It appears to go through a 8 bit port to the CPU data bus. You could map the SRAM into the memory map and do normal reads and writes to it. You'd need to resize the DSP bus to 16bits. Quite difficult as it's all SMD....
There are a lot of errors in the Falcon design, things like the burst mode not used for CPU accesses to RAM, SDMA bug, port size fixed to 16bit.

That latter problem has caused me a lot of problems. Do a move.b to read data from somewhere, say from expansion port and you'd expect only one of the -UDS or -LDS to go low. No, both go low. This means hardware has to allways supply 16bits. OK if you have some DRAM or something but if you have only an 8bit device you have to resize the bus, means lots of latchs and bus drivers.
You can't tell which byte is needed as the port doesn't carry the 68030 A0 line and both -UDS and -LDS go low. I
If Falcon was designed to respond as an 8bit port for 8bit transfers all transfers have to go over D31-25. That differnece from the 68000 is critical. IMO Falcon should have had the DSACK pins and A0 bought to the expansion port, along with the SIZ pins. Oh, and STERM if you wanted a burst mode transfer on cache fills.

Does somebody know how to send a message to as
many people you have in your addressbook? It says
something about using a commasign but that very
vague and nondescript for me...

Can anyone help?

I have seen strange things happening with Popwatch (another mail client) when it tries to retrieve the header (+ 1 line of body?) of some spam mail I get now and then.

These mails have only one single body line but is something like 20 000 characters long! Because some internal buffer in Popwatch gets overflowed it puts in garbled parts of other (Popwatch) files in the retrieved message.

When this happens Magic complains about "Memory violation" but strangely Popwatch itself is not killed but another app, Taskbar, gets terminated.

> Can you explain the printer drivers to me? What are the printer?.s
> files all about? I assume you rename the one (or all of them?) you need
> to printer?.sys.

First...what binary version do you use?
The latest, 2.6 proports to have all of the scoring features of CueBase Score. When I upgraded years ago officially to 2.4, Steinberg sent a HUDGE additional manual for the score editor. While the 2.6 code is now free, the manuals weren't.

Since I'm working from memory at this time...I'll do my best to remember how things work on the latest release...

There should be a Printer Setup Dialog somewhere in the primary menus across the top of the screen. Selecting this should bring a dialogue "Printer Configuration", or something similarly titled. Therein, you set your margins, paper type/size, and the units you prefer to measurements (imperal, metric, pixils, etc).
At the bottom of the dialogue there is a field that displays our currently selected printer driver file. Clicking anywhere in the printer selection area will bring up a file selector wich you use to point the way to the printer driver file you wish to use. CueBase shipped with several drivers stored in a directory called "PRINTER".
I'm thinking that you could have these driver files stored anywhere you wanted...on a floppy, on any hard drive/directory, etc.

Once you've set up your printer as you want it...these settings will be saved next time to 'save song'. It's a good idea to have your favorite printer set up saved in your DEF.ALL song that CueBase automatically loads each time you start it up.

Note: If you don't save a song after making your printer settings, then they won't be remembered anywhere. You can easily have different printer settings for different songs.

It's well worth your time to consider ways you commonly use CueBase Audio, and make template songs just to save your commonly used settings.

I.E. Your most used settings should be DEF.ALL as this is the song that CueBase will load up automaticly every time it starts (if present in the same directory as the copy of CUBASE.PRG you launch with).

I have several templates that I keep around for various ways of working or getting projects 'started'.
I.E. I have templates for jobs that are primarily MIDI, jobs that are focused on SCORE production, one for General MIDI, one for Primarily audio mix downs, and my DEF.ALL is a good starting place for the creative process. Obviously, my

audio.all template has a variety of coustom mixer maps and effect settings that I commonly use all ready to go, while my primarily MIDI, or General MIDI templates have all of the MIDI editors and Mixer Maps/Sysex Files, etc...that I most commonly need at my fingertips.

It's not uncommon for me to begin with a MIDI only setup and do all of my planning and note taking there. Once I'm done with the bulk of my MIDI related tasks...I'll save it as a SEQUENCE or set of SEQUENCES and then go to my Audio Template...load in the completed MIDI sequences and tuck them neatly out of the way...only activating various MIDI modules and editors if needed. All of my favorite audio functions are ready to go...I litterally have DOZENS of MIXER tracks down my screen...all muted and waiting, with hundreds of commonly needed snap shots also ready to go. Above all of these are 7 empty mono audio tracks all set at 50% volume and panned center, ready to roll. Here's a scaled down example:

I've set my hardware up as needed.
I've set up my favorite display, punch, tempo, printer, etc...

I've quite a few FX/Mixer settings that are pretty standard start ups for the types of mixes I do most often.

*On my default Audio Song...It starts with ALL tracks MUTED

Audio Tracks:
1 - Master Sketch - any
2 - empty - 3
3 - empty - 4
4 - empty - 5
5 - empty - 6
6 - empty - 7
7 - empty - 8
Audio Mixer/Effects:
1 - EQ Stereo
2 - EQ Mono
3 - Ambiant Vocal Reverb (Coustomized to good defaults by experience)
4 - Wet Echo Chamber (Reverb)
5 - Pop Filter (Filter)
6 - TwoGuitar Chorus (Chorus)
7 - TomTomCity (Reverb)
8 - Cymbal Sizzler (Filter)
9 - BrassLine Crunch 1 (EQ)
10 - BrassLine Crunch 2 (Filter)
11- BrassLine Crunch 3 (Reverb)
12- Mellow Sax 1 (Filter)
13- Mellow Sax 2 (Reverb)
ETC.
MIDI:
1 - Master Mix
2 - Empty
(I add these as needed one at a time after having done more tedious MIDI work from a different template loaded with all my favorite MIDI needs).

I made the template and saved it as AUDIO1.ALL
I actually have several of these for different types of projects. I.E. I have a 'DJ' ALL file this is suited to cutting and pasting segments of prefab music...like when the local Miss America wanna be hands me an 8 minute karoki sound track that she needs somehow cut down to 90 seconds with her back up vocals only in the right channel...per her pagent Diva Master's regulations. I have a Jazz Combo template, that's designed to get me started on one take rehersal session recordings that I mix down later (session itself usually recored in one take across all channels of a cheapo 4track cassette machine). The list goes on...

As you do more projects, and find yourself making the same settings over and over per your needs and tastes...you'll quickly begin to learn what is useful to have in starting templates. Your printer settings are no exception to this... Everything you do gets saved when, and only when, you SAVE SONG (*.ALL).

Finally...
There is a pretty good set of printer drivers. It's highly possible that you've a printer that isn't listed; however, chances are very good that one of the drivers will work for you. CueBase just needs to find your printer's raster dump mode and a reasonable resolution, and it's good to go. Since most printers out there will understand ESC2 or HPCL 5 or later, SOMETHING should be able to work for you. I.E. If you have an Epson Color Stylus 800, but don't see that 'particular' driver...most any of the Epson drivers will still work. Even the OLD 24pin drivers often work with the newer printers of same brand (albeit the resolution may not be so good). Try several, starting with the printer known to have similar resolution possibilities as your printer. I.E. If you plan to print at 300DPI and don't see your particular driver listed, go with the closest thing you can find that supports 300dpi or higher until you've located the one that does the best job. Chances are good you will find something that works at an acceptable level. It's also worth noting that resolutions in the neighborhood of 300dpi should be good enough to give excellent looking scores with CueBase Audio.

If all else fails on finding a suitable printer driver...
Have CueBase print to an image file. There is a driver to do this...I don't recall exactly what format it uses, thoe I'm guessing it is the Atari IMG format. You can then import that image into something like Calimus, PageStream, or Image Copy to print.

Hope this helps,
Brian

P.S. If you take me off your anti-spam list it's possible that I might be able to send you example song files, MixerMaps, and such in the future.

I have a copy of the newer Harlekin95 here but it is not for sale.

You might try Indigo2 at http://www.indigo2.dk/ He used to sell Harlekin
but it is not on his Atari price list any more.

He definitely has more stuff to offer than is on his list so perhaps he
can find a copy of Harlekin95 too. Harlekin is also a Danish program btw.

You really should invest in a webbrowser so you could check it out
yourself. I recommend CAB 2.8 or you might try to be as clever as the
original poster and try Lynx via the CLI at your ISP...

This valuable advice may be of good use to all readers in the 5
newsgroups it's crossposted to...

>vague and nondescript for me...

You must enter a name for your distribution list in the Name field in the
addressbook manager, and then type all the names in that you want to send the
message to in the Email field, comma (and space) separated. Click on "Add"
when you've finished. Address your message to the new address you've created.

You can add other distribution lists to the one you've just created as well.

>First...what binary version do you use?

I have 2.6. My printer setup seems to be working correctly. I was just wondering what the printer1.s, printer2.s, printer3.s, printer4.s, printer0.s files in the cubase.dat folder were all about. When I first set up the printer, I selected the driver for my printer, and upon testing got a message saying that cubase could not find the printer.sys. I changed the .s on the previously mentioned files to .sys, and that seems to have worked, but I am not sure it is correct to change them all.

Thanks for the info. Some very good insight! I am getting a good handle on using the program now. Just remove the <sick-of-spam> to reply directly. Is there any way to create multi-measure rests in the score editor, or do you have to have a whole rest for every "empty" measure?

As I said earlier, it's commercial but I am not sure that HiSoft
can still supply. I suggest he try them.

Alternatively I have an original copy of Harlekin II with manual
(for the original version) - if interested, he can make me an offer.

Regards, /Peter/

Sometime in '85 BYTE magazine had the Atari ST on the cover. Can anyone
tell me what month? Thanks.

There were *two* BYTE magazines with Atari ST's on the cover.
One of the '85 issues had an Atari 520 ST, and IIRC, the
January 1986 issue had an Atari 1040 ST.

> Is there any way to create multi-measure rests in the score
> editor, or do you have to have a whole rest for every "empty" measure?

Indeed there are a couple of methods depending upon your application.
Experiment.....

MULTI RESTS

Whenever more than one-bar rests occur, Cubase Score can replace it with a multi-rest symbol. In the Page Mode Settings dialog, which is reached from the Format menu, there is a parameter allowing you to set how many empty bars in a row should appear before Cubase decides to collect them into a multi-rest. "Off" means "never".

Sometimes you don't want that however...
Experiment with this...

SELECTING A SYMBOL IN THE PALLETTE

1. Position the mouse of the Symbols type selector in the score editor and click. A pop-up will appear. Choose Layout. You will find the multi rest symbol in this pallet.

2. click the multi rest symbol to activate it.

Note that there might be a difference between the automatic rests CueBase Score puts in an empty bar, and a true rest event that can be hidden/moved/maniputated. If you try to work with these 'default' rests shown in 'empty bars' and nothing happens, then you might have to insert actual rest events into the measure(s) in question for this to work. You'll have to experiment because I forget exactly how CueBase behaves with the multi rest symbol. You might need to insert user whole rests into each bar by hand, hide them, then position your multiple rest symbol. Trial and error, but hopefully this info will get you on track.

To insert a rest...In Editor Mode:
Select a note value either by bouncing the mouse pointer at the bottom of your screen and selecting a note, or by using the upper number keys (or is it the function keys...I forget). Right click, select the quarter rest looking thinggy in the pop up, and then click in your score where it should go.

In any case, you will want to hide all of the whole rests somehow, and I think you might have to hide the bar lines as well...been a LONG time since I worked with it.

HIDING/SHOWING ITEMS

Any object on a page can be hidden, including notes, rests, symbols, clefs, bar lines, even entire staves, you can make a page totally blank by hiding! (well, actually, one staff has to remain shown). Applications are shown below.

HIDING

To hide items proceed as follows:

1. Select all the items you want to hide.

2. Select Hide from the function pop-up menu, click on the Hide button on the Toolbar or press [Alternate]-[B] on the computer keyboard.

HIDING IN THIS LADYOUT ONLY

If you want the Hiding to be "local" to the current layout, hold down [Control] when selecting Hide as described above.

VIEWING HIDDEN OBJECTS

If you switch the Score Editor to Edit mode, all objects will be visible. Switch back to Page mode, and they are invisible again.

If you select Show invisible from the pop-up Option menu and activate the "Hidden" option, all hidden objects will be indicated by a "Hide" text item.

WHAT IS A LAYOUT?
In short, (there are a couple of complex chapters about layouts, however, it's relatively intuitive). Anytime you select a track or group of tracks from the arrange window and then enter the score editor, something called a "Layout" is automatically created. For instance...If you first select ALL of your tracks as a full score, it will open an editor window with those tracks sitting there ready to be worked with. All of the settings you make in there are part of a "Layout". Now lets assume that you'd like to make a simple rehersal score that only has the string parts...so you've selected only string tracks and opened an edit window...you've just created another score layout, which can have settings independent of your Full Score if you like. On down the line...till you've created layouts for individual parts.
It is possible to create layouts for one track and copy or import the same settings to other tracks, and so on. Layouts can be named, saved, loaded, etc independently of your entire arrangement or song.

Without a manual, best I can tell you is to explore...
Thoe it's pretty complicated and powerful, hopefully my little overview provides enough reason for it to be fairly intituive with some practice.

A couple of ways to get at your format lists:
Once one or more layouts exist (if you've done anything at all in a score editor window and closed it with [keep] or otherwise verified that your work there is a keeper...then you will have at least one layout), In the arrange window, select "Select" from the edit menu. At the bottom of the sub menu that appears you will find an item called "Score Layout". Move the pointer over this item and another pop will display, listing your Layout(s). Select one of the layouts, then open the Score Edit by selecting Score from the Edit menu, or by pressing [Control]-[R].

Another way to see a Layout List is found in the "Page Mode Settings".

Note there are two modes in the score editor. Page Mode and Editor Mode.
Page Mode is typically used to see how things will look when printed out, where editor mode displays more of the vital information of what is going on in your score technically. Some things only work in one mode or the other, some work better in one mode than the other, etc. In short, if you find yourself not able to do something you need in one mode...try the other ;)

Hope this gets ya going...
Brian

Yup,

Lonny and all, I found the src :)
All of them (might not be the latest, but pretty close I believe),
I packed them all into 1 zip archive, you guys can do whatever you wish
with it.
The src are rather well commented, and are good skeleton for other GEM
projects, a bunch of defines, procedures you can use.
Anyway, all in GFA and/or LST with rsc and all.

Available at

> Considering new they were well over $1000, not that long ago.

Depends on the point of view...

Here in Middle-Europe a TT with truecolor-graphic-card could be bought 3
Years ago for 145$. A ST-Book for 100.
So why should a Hades be worth more than 300$?

Maybe in other parts of the world the (private-selling-)prices are
different... :-)

Greetings, Werner

well, smptgem was supposed to be a cliet/server relation to popgem
(passing strings, subject/email address, body to a temp area (memory or
file), then spawn an editor (3rd party) then wrap all that to a 3rd party
smpt client (unix mail etc). So basically just a GEM interface to a lot of
3rd party software. I just hate reinventing the wheel :)
Bad side is that you needed a good editor (qed, luna whatever) and good
and WORKING smtp client. (I like modular design).
That's pretty much it.

Yes prices are much different in the US than Middle-Europe. Here you
would be lucky to get
a TT for $145 let alone one with a graphics card. If you are looking at
buying. It is possible to get
a TT for free from someone leaving the community. However those aren't as
common ;)
I've known this to happen here.

Outside of southern California, I don't believe Atari hardware ever reached
the level of market saturation in the US that
it did in Germany. That taken into account "High End" Atari's still fetch a
price in the US. When you start looking
at something like a Hades for $400 it sounds like a joke. There aren't that
many here and the people I know that have them aren't interested in selling
them.

Sounds like there would be quite a market for someone to buy ST Books,
Hades etc from the german market and sell them to North America. You could
do a 20% mark up and still have happy customers ;)

Best shareware desktop replacement is Gemini. It's german but good. I don't know if it works with an emulator though. NeoDesk 4 is awesome but commercial. Thing is also very good but shareware. There's also TeraDesk which works pretty well too.

It cost me about $40 usd to get just the motherboard and rage pro
shipped from medusa to the US. But it was well worth it. ;-)

Hello folks,

Sorry for the post but I just wanted to let everyone know that linking to http://pikachu.atari-source.com is no longer correct. I built a webserver specifically for the site and all server related stuff and it is now correct to link to either http://atari-source.com or http://portal.atari-source.com. I apologize for the trouble, please update links and bookmarks. Lonny, and others, this server will host news in a day too. The address will be news.atari-source.com, please update.

Hello Mat,

Have you tried Tim's Atari Midi site:

http://tamw.atari-users.net/timidi.htm

If it is not there, I am sure Tim an help you.

I think those are Flash files? Someone sent me one and it
played when I dropped it on the IE window on my Mac.

They are flash files and there is no Atari that will play them. You need to download Flash on a PC/Mac and then play the files on your browser. Go to http://www.macromedia.com

hmmm i sent the key to all the mail I got for the registration.
I guess I didn't receive yours, or I might have messed it up.
Really sorry about that, you should have emailed me for a status on it.
Anyway, the src is out, I am sure someone will remove the GFA bits about
the key registration. (not hard at all).
Anybody can then use it without a key.

I work with SWF files all the time. It isn't a video format, actually. It is an interactive computer animation format called "Shockwave Flash". The way it works, I believe (I may be wrong), is that it has a script that defines for the computer exactly what to do when, as well as a set of data to draw from (i.e. images, sounds, etc.). For instance, instead of running a video with a set size and ratio, it will tell the computer, "put this set of letters on the screen at this point size relative to the total screen size, perform a mathematical algorithm for causing the individual letters to loop around the screen 'follow-the-leader' fashion, for x amount of time, then fade in an image behind it half-way through." It is an extremely CPU intensive. But when you have a good enough system to run it, it will create very slick animations, including making text and images fly around the screen with constantly changing aspect ratios, fades, etc. and the animation itself is resolution independant, so if you change the size of the animation, everything grows bigger (i.e. font sizes, etc), keeping the same proportions as before, without getting "Pixelly" (except for bitmap images, which still must get pixelly when enlarged). It also allows interaction, in that you can assign an animated action to an input from mouse, specific keypresses, etc. It also has support for Javascript. They have games out on the 'net written in Flash (.swf) that are exactly the same, pixel-for-pixel, sound-for-sound, as the original arcade or console versions that run on any machine that support .swf files. Tons of web pages use them instead of animated .gif files because of the much smoother animation abilities and interactive possibilities.

Unfortunately, nothing that I know of for the Atari supports swf files, not even Aniplayer. And I don't think there is enough processing power to do it on most Atari machines out there. The only possibility might be if there is a Linux swf viewer that can be ported and run on 060 machines or emulators on fast PC's and Macs. But hey, if anyone wants to prove me wrong, PLEASE DO! I would love to run swf files on my Falcon!

I don't see what that has to do with what the guy posted, he was
wondering why Ben sorry BEN :-) didn't answer his question re an Atari
meeting place that Ben was himself talking about.

I'm not knocking Ben, just wondering why you are giving the other
poster a bit of stick re a perfectly reasonable question.

Btw, does flake equate to idiot?

If so that's a tad rude don't you think..

Hi Trip,

if you want to organize Atari Club meetings, it's fine with me. I'd be
happy to come and contribute. I used to be a SIG Leader for New Users
Groups for both 8 Bit and ST. In fact, I'm sending this to you on my
Atari Mega ST4 and Flash Terminal Software.

==Thanx==
===Ben===

For those of you who don't read your NewsGroups with a Web Browser!

http://www.aracnet.com/~atari/whybuyben.htm Here's the Winner!

Well, it's been a tough decision. Each entry looks good. But the winner of the "Why Buy Atari from Bravo Sierra Computers" is Reverend Tad Stinson! I chose Tad partly because He is a Reverend. Besides being a Professional Communicator who made the point quite eloquently! He has a unique point of view regarding the subject matter (Me!)! We get together once a week to eat out and come back to my place to play Atari! Were both avid Atarian DieHards and we speak on the phone nearly everyday. He knows me from a Point of view like no other! Still he gives me a glowing review. 2 Thumbs up! And as a Reverend, that adds a whole New dimension of credibility! As the Contest Winner, Reverend Tad Stinson receives the Cash Prize of $25! Anybody who's not persuaded by these, my Living References probably just refuses to believe! And for those who doubt the good Reverend! They have no Reverence for those who devote their lives to serving others! Whether as a Minister of the Gospel, or as a Dealer devoted to supporting Atari!

Contest Winner Listed Below:
==========

Dear Atarian,

Ben Smith is the greatest! I have been buying Atari hardware and software from Ben for over six years,and in that time have never been disappointed. He is always able to meet whatever Atari need I might have. He delivers excellent service, wonderful and useful advice, and sells his merchandise at a competitive, fair price. I have had the privilege of spending time with Ben at his home where he lives, eats, and sleeps Atari. He is without a doubt the most knowledgeable Atari expert I have ever met. If you are interested at all in Atari computers, I would highly recommend that you contact Ben Smith. He is a man of integrity, who can be trusted.

Sincerely,

Reverend Tad Stinson
Gladstone Oregon

Did you know that you can type "ansch*" into LEO, and get all the
words that contain that root, and get as confused as I did?

It seems to have the English meaning of "origin" or "original", as in
"original cost" which seems to be the sense in context.

If true, where the percentage entry? "Rest" I do not recognize.

If we are on the same page, I would expect to see "original value",
"percent per period" and "number of periods" in a linear depreciation
calculation.

Does anyone know the correct syntax to use the program binpatch.ttp? According to a text file with BigDos the files binpatch.ttp, ahdi.prg and ahdi6061.bdf have to be in the same directory, and then just run binpatch with ahdi6061.bdf as an arguement but all that happens is binpatch prints out the list of commands, but they are all in German. Any help would be appreciated. Or if there is already a version of ahdi.prg patched for XHDI that would be much appreciated. Thanks.

Nicholas

The posts in question were almost two years old... I take it the club was going strong back then? But I wouldn't know because I never was able to get information as to where to go and when.. And then there was another post pertaining to a night to get together and play on the console systems... I wrote back saying I was interested but received nothing but a one sentence reply saying "I'm working on it" or something to that extent... I answered another one a couple of months later and received the same reply..

So trust me man, I wasn't the flake here.. I mean, I'm not questioning his business ethics or anything but I don't know, maybe I would have bought some stuff from him if these meetings took place?

Ben,

Thanks for the reply but there's no way I'll be able to organize meetings with my schedule.. And I'm not that knowlegable with the ST line... That was one of the main reasons I wanted to attend so I could get to know the computer better... However, if you're still doing the console thing, let me know..

Thanks,
Trip

A long time ago..and I mean a LONG time ago, there were several Atari groups in the Portland area.

Myself and a few others got together and attempted to bring all these groups together under one single body. I think we called it the Northwest Atari Treaty Organization (NATO). I was much younger then and not as creative with names (can't say I'm any better now).

The leaders of all these groups felt threatened that we were trying to take over their groups and toss out their leaders. Quite the opposite - we were attempting to unite all the groups together to form a stronger presense in the Portland area. I believe had we been succesful, the fate of Atari Corp, and it's followers may have been somewhat different or at least delayed - maybe not.

So, given what you've heard from your inquiries and knowing a little about the past representation of the various Atari groups, I'm not surprised by the one liners and lack of more enthusiastic replies. I didn't find the Atari group representatives to be very skilled in the areas of social interaction.

I gave up the NATO idea and sold my 16 bit Atari and moved to Mac platforms. Later, I switched to Intel architecture where I remain.

Users groups at one time offered a great service to the community. Under strong leadership, they offered new users a "warm spot by the fire" so to speak and helped educate them in the basics of the system they chose. There was decent social interaction - I actually made a couple life-long friends from my involvement in the Commodore users group in Eugene, OR.

Any more, tho Intel architecture dominates and folks can get as much information from the web or from newsgroups such as this. Additionally, they can turn to Ebay for all their trading needs. Sadly, the PC user groups are falling by the wayside. I'm sure Ben's doing a good job

trying to keep this alive, but eventually good intentions must give way to reality and he needs to eventually face the fact that the Atari market is dwindling and unless a developer is really doing this out of the goodness of their hearts - hardware and software advances are going to eventually stop completely.

I'm not sure where I'm going with this, but I've seen these Atari posts regularly, and while annoying, you can't deny a person free speach. You My newsreader (X-news, it's great stuff) has an easy-to-use filter and I put it to good use. Folks not interested in seeing this stuff might do the same.

At any rate, that's Zammer's history lesson for today. Sorry it was lengthy, but hope it's of some value.

Zam

2307. Bravo Sierra Article

Newsgroup: comp.sys.atari.st
Date: 2002-09-14 05:15:46 UTC
From: duwolf@hotmail.com
Message-ID: <4cd3b1ba.0209132115.6d3f58c@posting.google.com>
Source record: 32167

Hello folks,

Ben emailed me regarding not seeing the Atari-source.com article. I seem to have lost his email and am not sure if I responded or not. Some notes regarding the article. I do not mean to blow sunshine up my own ass, but the comments at the end are merely a way of saying that anything is possible, and education on an atari is possible. I'm not a braggart but I am proud of what I have achieved at age 21. I've worked hard to get where I am, so I hope I don't come off as a complete asshole.

I figured to save everyone some hassle, here is the direct link to the article:

http://portal.atari-source.com/modules.php?op=modload&name=Sections&file=index&req=viewarticle&artid=20&page=1

And below I will post the entire contents of the article:

First and foremost, here is the original article posted on http://www.aracnet.com/~atari/antispam.htm. The proprietor in question's name is Ben Smith and here is my reaction...

Original article:

Please Read this Page all the way through before you form your opinion..

Even though we can do a lot with our Atari's. I find myself quite limited using my ST on the Internet. Sure, Many Atarians have adapted New SoftWare so they can more fully use the Internet. I can't do that. I'm mentally impaired. Besides being accused of being Crazy for not owning/using any Computer and/or Game Machine (Jaguar) except Atari. And resisting salesmen and the rising Tide of PC/MicroSoft/MAC! Due to my Disability, I Log onto the InterNet with my Mega ST4, Antique Terminal SoftWare & 14,400 MoDeM! I learned how to be proficient with my Antique Atari Computer back when I was able to study New ways of getting On-Line. I'm Limited to ways I can Promote my Business/LivelyHood. Most Tools for on-line Business aren't for Atari. Especially with my Limitations. That is why I CrossPost to News Groups to survive as a Business. If you consider the thought/intent of the Rules behind CrossPosting. I'm an honest BusinessMan trying to make a Living Supporting the Atari Community. Most of those who Condemn me for Spamming either have no interest in keeping the Atari Community Alive, were Never interested in giving me their Business or are at an extreme on the Letter of the Law on Spam and throw out the Baby with

the Bath Water!

You may of noticed I've changed the way I Post my Messages. I've Learned a few things. I've learned I don't need HTML in my Post to link my WebSite and WebPages to NewsGroup Posts and I've learned to be a better Web HTML Programmer. In other words, instead of trying to put all the information in my posts, I've learned I can move that information to my WebSite and use HotLinks to Link my Customers to my WebPages through my WebSite. Thereby Shrinking the BandWidth! I don't know if I can always do this but as long as I'm able, despite my Mental Disability. I'm going to try! And to those who yelled at me without bothering to clearly explain why? You may not know it but I only use an Atari. Including going On-Line! So I can't see what you all see on your PC's and Mac's when your On-Line! So while you were screaming about my Posts! I was like a child you yelled at, understanding only on a simpler level. I hope we can put this behind us!

After reading this article, I must truly wonder if Ben Smith does have a mental disability, as mentioned. After all, even using only an Atari on the internet, one can relate most experiences on the internet to things that happen within real life. Imagine a world of being bombarded with advertisements. Would you really want it?

Let's use a real life analogy. Once a year there is an Atari show, the biggest Atari show where everyone who is even slightly interested can magically get time off work and from families to come and attend this three day show. At this show are some 100 exhibitors and of course all of the customers. Let's imagine for a moment that one particular exhibitor placed his signs and directions to his booth all over the auditorium. He is after all a small business trying to survive in a small faction of a market. Is this an unfair advantage to play less by the rules? Well yes. Until Ben Smith is the only proprietor of Atari software and hardware, he is using newsgroups and his ignorance of people actually speaking up because of the problems with it to his advantage.

In this hypothetical auditorium situation, Ben Smith would be using all of his resources to advertise his business... unfairly. Let's say the main organizers allow advertisements in flyers, tv monitors, and other resources. Other exhibitors use these mediums, and pay for it, but nonetheless it is slightly less effective.

And let's talk about this Internet learning disability... The MiNT kernel and other parts of it are modeled rather directly from Unix who in essence birthed and powers a vast portion of internet servers. Atari's can run apache web servers, ftp servers, telnet servers, etc. In your local bookstore there are plenty of books on these subjects, including netiquette, that apply not just to PC's and Macs but to all platforms. I too am an American, and while Internet usage is more

prevalant on PC's there is absolutely nothign stopping you from seeing on an Atari what you can see on a PC.

The simple fact is Ben, that if you do not have the ability to adapt to an environment or learn a particular skill then you shouldn't do that. This is something I firmly believe in. I do not believe people should be allowed to drive cars without having a basic foundation of knowing how the car works and how to troubleshoot on a general level what is wrong. It applies to all parts of life. If you do not know how to program software, you do not get to be a computer programmer, if you do not learn to drive properly and follow the rules of the road you do not get to drive. No matter what you do, a certain level of adaptation must follow. No matter how simple windows is, there are people that get it, and people that don't.

The problem with your posts to comp.sys.atari.st, and other groups is simple. Your content is the same primarily. At times we can see more then one post of yours in a week. You contribute not much of anything to the discussion, you do not answer specific inquiries for a product or package. Compare this for instance to Barrie of Keychange music. Barrie never all out advertises his business in a self contained post, but instead waits to see someone in need, with a need he can fill, and chimes in to plug his business, letting the person know that there are dealers out there who can help.

The difference is that Barrie's method requires more work. He must read through posts and contribute to conversations and get to know the community, whereas all we ever ever ever see from you is advertisements. It's not that we don't like you, it's that it's a community forum that you are exploiting for ONLY your own advantage. The problem Ben is not that you have a learning disability or that using Atari computers causes you to somehow miss out on advertising techniques, but quite simply the problem is that you are lazy.

If you were not lazy, you would see the problems with your current methods and change to a more subtle method that requires more effort on your end. You would get involved a bit more and try to gain a higher internet presence. Did you know that since Atari-source.com opened in December of 2001 we have had almost 60,000 page views? That is a significant exposure. You could develop relationships with web portals and news providers and work to get your site linked to from these sites. Who knows you might even be able to pay some of these webmasters actual money in order to plug your own business. Alas, this probably isn't necessary because most sites I know of, including mine, would probably offer up a large banner to your company's website absolutely free. Most webmasters would even offer to design your banner for you, though you could easily do it with Papillon or Smurf on your Atari or any other of the NUMEROUS graphics packages.

Nobody has been exceptionally hard on you Ben. We're just waiting for you to figure out for yourself why you are wrong to do this. The internet is exactly the opposite of what you think it is, it is a vast

network of resources and information just begging for you to learn how to properly use it. The information is out there, it is easy to provide your own domain name and serve all of your web site right off your Atari from your own home. Computers, and learning about them has nothing to do with disabilities and more with how much effort you really want to put into it.

Lastly please keep in mind that I have quite the right to publish such an article. My first computer was an Atari and it is the foundation of most of my computer training and education. The first computer I have ever crawled the Internet with was an Atari TT owned by my current roomate. I purchased a PC only to build a real world education of computing today so that I am marketable to employers, but I assure you, my Atari is where the real education was at. Today I am a Systems Administrator fo ra large company, a position acheived with literally no college education. To say that one cannot get a broad education and is limited by using Atari is like saying that you cannot learn how to drive because you must drive a Chevette instead of a Corvette. It's an argument that just doesn't work. Nobody hates you Ben, you do a wonderful service to the Atari community, but we need everyone to play by the rules. Newsgroups are an open forum. Advertisements just do not belong there in the method that you post them.

You can try to buy it directly from ASH the german company that sells NVDI.
I think they will send it to the USA. Ask them.

http://www.application-systems.de/

There you have an on-line shop and a contact e-mail.

Hello Frederick,

Actually I did not send in the resgistration to you, I sent it to Kellis. That was the only name I had. Doesn't matter, I just wanted to support the author. The program works fine under StIk and GlueStik.

Thanks for the explanation Mike. I will have to get Flash for my wife's PC.
Too bad I cannot play the file on my Hades computer. I know it could be done
if I had the correct program. No conversion program??? Maybe someday.

Hi Nick

Why would they, they actively encourage Ben-Dover from good old-boy club Bravo Sierra, so what if its against the rules!.

What I suggest you do is post your complete shop inventory here twice a day, then we can quote it in any future un-related replies, then I'll come along and complain about it being against the rules, quoting said inventory of course, and then look forward to some more malicious, abusive and threatening private emails from anonymous arseholes.

BTW, hi assholes, I'm really scared you know.

P.S. to said anonymous assholes, take some advise, you really /don't/ want to meet me on other than friendly terms.

| Hope you don't mind me doing a little self promotion
|

>Did you know that you can type "ansch*" into LEO, and get all the
>words that contain that root, and get as confused as I did?

LEO, didn't think of that!

>If true, where the percentage entry? "Rest" I do not recognize.

Dunno, as I've said to Gerhard I'm no mathematician!

This is how a couple of similar entries translate:

(Ansch;Rest;Dauer;Periode)|Arithmetisch-degressive Abschreibung
(cost,rest,length,period)|Arithmetically-decreasing depreciation

(Ansch;Rest;Dauer;Periode[;Monate])|Geometrisch-degressive Abschreibung
(cost,rest,length,period[,months])|Geometrically-decreasing depreciation
---

I hope it's not miles wrong as it will call into question the rest of this
file!

Cheers

Hi all,

just bought a nice HDD controler "ProFile" made by Protar or so. I would like to replace the builtin 20MB drive with some of my newer SCSI drives but It's got a proprietary driver I suppose. Also don't have any partitioning software, which would allow me to prep the drive for use under ST.

Any friendly soul with clues, URLs, uploads ;-) ?

2317. Atari STinG to WinCE howto

Newsgroup: comp.sys.atari.st
Date: 2002-09-14 20:38:32 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3d83ac448176e90@tripnet.se>
Source record: 32173

I have put up an article that describes how to make a TCP/IP connection between an Atari running STinG to a WinCE 2.0 pocket computer. There are versions in English and Swedish. This is quite cool as it makes it possible to surf on the handheld through its sync cable without any Ethernet cards etc.

I have also put up some more general info and longterm uptime data for the Weblight webserver I have kept online since Jan. 2001. 98.8% availablility over 10 months is not too bad for a computer running TOS...

Can be found at http://atari.mine.nu/network/

I've found this Atari dealer quite responsive and helpful despite being across the Atlantic. They do accept VISA and other cards (so currency swaps are instant and easy). You can request they email you a copy along with your license/key as you wait for the origonal disks/manuals to come to you via mail. Some software they are allowed to do electronic transfers so you get a working copy ASAP. Can't hurt to ask.

2319. Help needed for Microdeal Replay 4 software

Newsgroup: comp.sys.atari.st
Date: 2002-09-15 03:10:07 UTC
From: MrShoujo@webtv.net
Message-ID: <1574-3D83FA0F-482@storefull-2332.public.lawson.webtv.net>
Source record: 32176

OK here's the story:

A friend bought a package deal off a friend who originally bought it from someone and while we got some great stuff, one thing we finally figured out what the heck it is and I wanna use it.

I have the Microdeal Replay sound sampler cartridge and the Replay 4 software for the Atari ST. I made a backup of the software (took us a while to find it) so now I have that, there's only 2 others things needed...

My friend hasn't found the instructions for the software yet. I would like basic instructions and general tips on using the software, saving clips, audio levels I should be aware of, and... does the "525" utility take Replay's .SPL (or whatever they are) files and turn them into WAVs? The reasons I need the conversion software to make WAVs are the fact that the little Windoze 'puter we got has a mic but it doesn't work right for some stupid reason, and I want to make little sound bites from my Japanese anime tapes, especially of those where the original Japanese voices say names correctly (so I can cure dubbies of Dub-itis) and I do that by converting WAV audio files onto my Psion Revo aka Diamond Mako PDA and play the files there. The WAV clips I had hoped to find don't seem to exist on the net (apparently recent anime fans don't understand the need for the clips I want), so now that I have the Replay cart AND software, I'm just 2 steps away from using the ST has a high quality audio sampler.

Instructions and converting to WAV format utility is all that I ask. Please send private replies to the posting email address. Goodness knows I'm going to be spammed out of my brains for this, but I need the help. URLs to files I can download would be most appreciated. File attachments I can forward (that aren't too huge) to another email address would be cool but not necessary.

Source record: 32184

Hi all,

Having finally given up and moved over to the Mac platform, I am reluctantly selling my TT.

It is pretty much standard except it come with a Might Mic 64MB upgrade card. Now don't get all excited, I bought this card from Ebay and have never got it to work properly, the memory checks out at start-up but then bombs. Oh and it has a 500MB SCSI hard drive.

It has been re-cased into a VERY large tower case to give oodles of room for upgrades and unfortunately the original case went to one of my friends a long time ago.

I'm not really sure what this is worth nowadays so offers would be appreciated!

I also have a memory adapter board for a Falcon 030, just plonk a 72pin simm in and you have a 16MB falcon, again offers would be appreciated.

Tim

From: Claude Bourgoin <claude@pivot.net>
Message-ID: <3d84c172_2@corp.newsgroups.com>
Source record: 32186

I have a Falcon030 with a 100 meg iomega SCSI zip drive. I used HDriver 7.+ to format and partition. The problem I am having is when I run Magic 5.11 the Falcon030 sees the zip drive, when I just run TOS 4.04 the falcon can no longer see the zip drive. Does anyone know what I am doing wrong or missing a step in the process?

Thanks in advance for all help.

Sounds as if you have created a DOS compatible partition on your ZIP
cartridge. Please refer to the HDDRIVER manual for more information on
partition types.

Yes, that is exactly what I did. Because I needed to transfer some large files from my PC to the Falcon. I trtied running Bigdos but the falcon still didn't see the zip drive.

If you would prefere to purchase than make one yourself B&C
(http://www.myatari.com) probably stock them if your in or close to
the USA or Atari Workshop (http://www.atari-workshop.co.uk) for the
UK/Europe.

With Ntsc Atari St's, was the verticle refresh rate at 60Hz and at 50Hz for Pal St's? Does this mean that a monitor bought from an Ntsc region would need its verticle hold & size adjusted to work on a Pal ST? or is the monitor socket allways 60Hz regardless?

just interested.

NTSC Atari ST vertical Refresh at 60 by default.
PAL Atari ST vertical Refresh at 50 by default

Yes monitors from the different regions can be adjusted. There is boot
loader software
for the 50Hz refresh rate, that switches the ST over to 50Hz. There were
some really
nice versions of the 1224 that could be fine tuned to just the right range
to accept either
NTSC or PAL input. In my experience the best ones for this were the box
shapped ones
without the fancy contour of the original 1224.

OK. That says something. But I remember reading somewhere that "to make true ST images, you have to make them on Amiga" - due to some FDD controler description in the pc. Similarly to Amiga diskettes.

Now the question: are ST and msdos 720KB diskettes fully compatible? In other words: can ALL the data of a ST diskette be read using the pc FDD controler? In that case I could use standard dd on my linux pc. Otherwise I look for alternatives either for ST or Amiga. I simply have a bunch of ST diskettes, which I would like archive (and be able to restore back once) before they get demagnetised...

Any more info?

Due to the nature of the READ TRACK function of the Atari FDC it's
impossible to make a true copy of any floppy.

This is actually why it's possible to make copy protected floppies that
no standard copy program (using the FDC) can handle.

There are some solutions that use analogue technics and simply copies
everything the read head receives. This is rather tricky as both floppies
must rotate with the same speed.

Whith this method _any_ floppy can be copied if you are lucky.

Hm, just thought of something... Why not connect the output from the
floppy read head to the Falcon DSP and record it digitaly. Then do some
analysis on the data, clean it up and compensate for different floppy
rotating speeds etc. Finally write it back either in analogue format or
using FDC WRITE TRACK command after some rather complicated computations.
Not an easy task, though :-)

>Now the question: are ST and msdos 720KB diskettes fully compatible? In
>other words: can ALL the data of a ST diskette be read using the pc FDD

Yes and no :-)

There is really no easy answer to your question. If your floppies are
standard formatted on TOS 1.04 and higher any pc should be able to read
the data. If they are copy protected it will not work easily...

>controler? In that case I could use standard dd on my linux pc.
>Otherwise I look for alternatives either for ST or Amiga. I simply have
>a bunch of ST diskettes, which I would like archive (and be able to

>restore back once) before they get demagnetised...

The Amiga use a very different way of reading floppies without the ST/pc
floppy controller. That is why it may be possible to do true copies of
ST/pc disks on an Amiga. I have no further details on this.

Thank you very much for the reply. Now it seems that I start to get
somewhere with this problem. However:

Kenneth Medin wrote:

Do you have any more technical details on this? Maybe some URLs?

>

The same here. This is the same subject I guess.

> There are some solutions that use analogue technics and simply copies

> Whith this method _any_ floppy can be copied if you are lucky.

Yes. This is another story though. What I am looking for is a method of
creating the exact digital image of a ST diskette, using any common
hardware. This should be similar to the way C-64 raw GCR images are
created. If there are some tricks with the format of the ST, then it
looks that the Amiga seems to be the most suitable for this purpose as
it is known to be able to transfer raw MFM data (there is no hardware
decoding) with its floppy controller and can out-of-the-box read
everything but Macintosh 800KB format, which requires special drive
changing the rotation speed depending on the tracks. If I knew what are
the tricks with the ST's format I would be able to do something about it
using one of my old Amigas for example.

I would appreciate any further info on this subject.

This reminds me sampling the cassette tapes from 800XL/C-64 into aiff
sample and scanning it for the bits... ;-) Yes this certainly is
possible as the tape example shows.

Yes. Once again then: what are those limitations of the floppy
controller in the ST?

As above - it should be possible and I remember somewhere reading
somthing like this but am also lacking the details.

BTW. When I mounted a ST diskette it showed strange (garbage) volume
name. Is this one of the differences between ST and msdos format?

It's obviously an abbreviation, possibly for
'Anschaffung' = acquisition or purchase. Could also be
'Anschlag' = plot or estimate or
'Anschluss' = addition or
'Anschreiben' = put to one's account.
'Anschwellen' = increase (a less likely possibility).

I'd go for the first one if the context is something like compound
interest on a loan or mortgage.

For depreciation, "rest" is value remaining, or current value, or
remaining value. Something like "remain" or "value" would seem to me, a
sometimes statistician, to be preferable.

: Anyone any idea if the word "Ansch" in this line:

: LiA -3 5250 4 ; LiA(Ansch,rest,length)|Linear depreciation per period

: has an English meaning, and if so, what?

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for about 14 years, and turned shareware a while ago. The latest version, 8.2, was released October 10 2001.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://www.uvk2000.com.
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me via the website and I will refrain from posting to the newgroup in the future.
Thanks for your time.

I replied to Jim's suggestion for a translation for "Ansch" with the
original two lines of German text and their translations.

It looks like "cost" is the most probable translation.

Once this is confirmed I'll be releasing the English Texel 2.20 resource
files and other data files.

I'm not sure if I'll be able to do the text that's embedded in the binary
however, it's a very complex job :-(

Cheers

Derryck

Hi! I have some British Magazines(ST) up for
sale, most of them have the disk with them. Email me for a list of them
at:dane@buffnet.net

Thanks!

Dane Stegman

2361. Falcon030 mouse

Newsgroup: comp.sys.atari.st
Date: 2002-09-17 19:58:46 UTC
From: Britt Park <britt@sciencething.org>
Message-ID: <uof2bmsl97qk4f@corp.supernews.com>
Source record: 32120

Does anyone know a supplier for a Falcon030 compatible mouse? Is the mouse the same for the Falcon030 as for earlier STs?

TIA

Britt

2362. ST kits market ?

Newsgroup: comp.sys.atari.st
Date: 2002-09-17 21:44:31 UTC
From: exxos <exxos@home.co.uk>
Message-ID: <2nNh9.110$EWM.21233817@news2.randori.com>
Source record: 32121

Hi all,

I have been half developing ST upgrade kits as a hobbie. You can see what I am upto on my site. Mostely things like STFM addond/upgrades etc. I wonder if there is actually any call for such things still. The ST still seems to be going pretty strong though would you lot support efforts to bring out upgrades ? I plan to upgrade a few of the ST's I have and put them on Ebay with 1.44meg drive and 4MB RAM, this only can be done in the UK since its where I am anyway. Of course I will probably updrade my own machine though if theres call enough I will make up some kits for other people to use.

Check out my site, if theres no call for kits anymore then it saves me a lot of work updating me site and such things.

Chris

2363. Where is my LGD CD?!

Newsgroup: comp.sys.atari.st
Date: 2002-09-17 22:52:33 UTC
From: sword7@speakeasy.org
Message-ID: <uofchh1b0aod38@corp.supernews.com>
Source record: 32122

Hello folks:

More than a month ago, I ordered a 6 CDs pack includes LGD CD on LGD (Little Green Desktop) web site through PayPal. I did not receive that yet. I read notices on that LGD web site said that it might takes many weeks to many months to arrive. Does anyone have similar experience like that?

Thank you!

Hi Britt,

In short, yes you can use any st compatible mouse with a falcon, whether its the plain st mouse, beetle mouse, golden image or one of the others.

2366. FS: Atari ST compatible monitor switchbox and TAC 50 joystick -best offer

Newsgroup: comp.sys.atari.st
Date: 2002-09-18 02:11:30 UTC
From: Jonathan Pruitt <jpruitt57@comcast.net>
Message-ID: <B9AD57A3.B3F0%jpruitt57@comcast.net>
Source record: 32124

anybody interested in the following items?

1) A monitor switchbox for an Atari 1040st (possible compatible with other models, but I don't remember much about atari computers anymore, other than the fact that mine ran more solidly than anything I have owned since) . I used it to switch between monochrome and color monitors on 1040ste years ago. good condition.

2) a TAC 50 joystick, used, in good to excellent condition. 1040ste compatible.

please email me at jpruitt57@comcast.net with any reasonable offer.

Cheers,

Jon Pruitt

Chris,

Dont dissappear on us. If you leave without selling me some of those upgrades
I'll come over to your place really late and yell "BUGGAH" until the neighbours
wonder what your up to.

2368. Atari Web-Site FAQ!!!

Newsgroup: comp.sys.atari.st
Date: 2002-09-18 02:16:16 UTC
From: carey christenson <firest@williams-net.com>
Message-ID: <1032290214-935871AEicMi@williams-net.com>
Source record: 32127

Everyone,
Here is a ***NEWLY*** updated list of everything that I have and some of what people have given me in my e-mail. Thanks to all who have sent me there favorite web-sites!!! This is meant as a good resource for people to find web-sites related to Atari computers. This list is by NO means complete and can always be added to or deleted from if found that a site is no longer operational. Please direct all comments to me at firest@williams-net.com. Please if you have any web-sites to add to this list by all means send them to me and I will add them in. If you find a web-site that NO longer works let me know and I will check it out. I will do my best to update this list at least twice a month and post in this newsgroup. If this becomes to big I will break it down into smaller messages and post each message one a day as to not overload the newsgroup!! We as Atarians must band together to help to ensure the survival of our platform!!

Thanks,
Carey Christenson

Claude,
I have one machine that has a similar problem, a MSTE-4mg with a 1224
monitor running MagIC 4.1 during the boot process the screen will start
pulling and distorting. The cure for mine is a small program called
Rezflip in the Auto folder and all is well

Donner.....

I forgot to mention that the best solution in your case is most likely a
partition that is both DOS/Windows and TOS compatible. This way you do
not need any additional software for the Atari.

Hal.Turner@HalTurnerShow.com

Isabelle! You'll jump pickles. Tomorrow, I'll wander the frame.

They are smelling about clever, at sick, through dull walnuts.

What did Dilbert lift the lentil alongside the sharp printer? Plenty of empty tapes beside the thin morning were seeking under the lazy square. He'll be recommending for shallow Milton until his weaver plays stupidly. These days, go solve a boat! Get your superbly irritating cup against my camp. Some cars freely call the bad forest. It irrigated, you attacked, yet Sharon never generally covered alongside the navel. Plenty of oranges will be pretty inner buckets. Will you pull behind the ceiling, if Sam stupidly talks the dust? The case against the deep field is the raindrop that scolds wickedly. If the cold tyrants can shout wanly, the smart bush may care more planets. While coconuts hatefully waste twigs, the jars often climb in back of the elder plates.

Well, it kills a hat too outer without her young earth. It's very hot today, I'll taste tamely or Morris will sow the elbows.

Nowadays, drapers believe under open springs, unless they're durable. She should dye urban lemons outside the ugly dry mountain, whilst Gregory gently pours them too.

Whilst not wishing to stifle your efforts I should point out that all your 'half developed' kit is already available, tried and tested, from Keychange and other suppliers. You should try to develop something new, such as a USB adaptor.

Another point to watch is that whilst making 1 or 2 items is a hobby, when you have to build 50 or 100 to fulfill orders it suddenly becomes a chore, especially when the phone don't stop ringing, "Where's my upgrade?"

Been there, got the tee shirt.

Barrie at Keychange. www.keychange.co.uk

I was a bit surprised to see that you are selling copies of the AC
Millenium Time Capsule CD for £6 plus £3 for postage!!!

We produced these CDs and gave them away free with the last issue of
AC. I think we made them available for a small sum if anyone wanted a
spare.

If anyone wants a copy of CD I have about 15 here and am happy to let
anyone have one for free upon receipt of a suitable small jiffy bag
and return postage.

£9!!!

That's not on mate...especially for something that was given away free
in the first place!

These CDs I have are genuine originals, not 'burns'. Due to the
copyright nature of some of the contents of the CD ROM no one has
permission to make copies of the Time Capsule CD ROM for resale. Not
that I am saying anyone has I hasten to add!

Yes and at a good price also. I have seen all whats around and not really what I am looking for in one way or another. I am supprised to see around hard drives which are 50MB selling for 100quid, not only from your site but elsewhere, not picking fault with it just most places are selling stuff which is pretty behind spec now at way over spec prices. I want to bring out resonable price upgrades. If there are kits already out there then please let me know, would save me a hell of a lot of time if I can jsut buy them cheaper than I can make them.

Maybe though I really doubt it will happen. Even though I have on sale a 1.44meg drive kit for £40, which I think is a good price considering everyother one ive seen is a lot more than that, I doubt ST users would pay 40quid for a 1.44 drive kit. Even more so if the price is higher for the external drive I built which cost me around £70 to build. though Ive seen stuff high price than that for the same. Most of the stuff is solder in so I doubt theres enough intelligance out there to do it without buggering summert else up in the process. True theres plugin kits around but I dont like them one bit.

I had AC but never got the CD, if it was given away free then why didn't I
get a copy with my AC mag ? I'm sure it was being sold in the latter issues.
I don't even remember seeing it in there without looking it up. fair enough
though, if people can get stuff for free or better stuff from elsewhere then
I will happily close down me site, would save me a fair bit in running costs
for a start!

I will still build the 1.44 controllers up, Im building 5 probably up soon. I'm almost done with the 4meg STFM boards also. I will probably build just enough to fixup my ST's. I will have a quick go at a the CPU kit since Ive ordered the new CPU's now anyway though seeing what someone else said all the kits are already out there ?!?! I sure haven't seen anything at a value price which is why Im building my own up. If theres no call from other ST users out there then I will just fix up my ST's and im happy to do that.

I will soon have a loads of ST stuff for sale on me site. since I am in the UK it will be hard to post heavy things off. I will draw up a list and take some pics and list it all on my site. I dont know when I will have time to do this but hopefully soon. Some of the ST's will be upgraded with the kits I built and/or some test machines which were upgraded. I would have expected better responce from Atari people to support such efforts but like always im proved wrong :-\

Cool to see you activly working on stuff for the ST!

My STFM hasn't been used for a while now, and due to a duff floppy (which I
have no idea how to repair) it's sat around doing nothing.

Shame really

>
>Do you have any more technical details on this? Maybe some URLs?

Well, the FDC is a WD1772 and descriptions of the commands etc should be possible to find by a Google search.

Exactly how to program the FDC via DMA on an Atari might be harder to find on the Net...

There are lots of different ways to make a floppy copy protected. There is no simple way to just copy everything. You have to analyse how the formatting is made and try to create an equally formatted track.

Some of this can be automated like in some copying programs but I don't think it's realistic to write one that can reproduce _any_ strange format scheme.

Basicly you use the READ TRACK and READ ADDRESS commands and examine how the track is formatted.

Then you setup a buffer with the format pattern including some special bytes ($F5 to $FF) for ID fields, CRC's etc.

>> This is actually why it's possible to make copy protected floppies that
>> no standard copy program (using the FDC) can handle.

One way (not using WD1772) is to put in very high sector numbers (above $F4). As these numbers have a special meaning to the FDC when creating a format like disable clock pulses, there is no way to copy this format using WD1772.

>Yes. This is another story though. What I am looking for is a method of
>creating the exact digital image of a ST diskette, using any common
>hardware. This should be similar to the way C-64 raw GCR images are

Exact digital copy would be to use the analog input, clean it up and write it back.

>changing the rotation speed depending on the tracks. If I knew what are
>the tricks with the ST's format I would be able to do something about it
>using one of my old Amigas for example.

I suppose you cold overcome my example above with Amiga hardware.

>> Hm, just thought of something... Why not connect the output from the

>> Not an easy task, though :-)

>This reminds me sampling the cassette tapes from 800XL/C-64 into aiff
>sample and scanning it for the bits... ;-) Yes this certainly is
>possible as the tape example shows.

I really like this idea and it might be a final solution for this problem
with old copy protected floppies that go bad and can't be renewed.

Think of a floppy drive connected to some special electronics and
conected to a pc soundcard line in/out and perhaps the printer port. On
the pc write a program that reads the raw data. After cleaning up
(digitally) you could then write everything back and get a true copy.

There might be a market for such a device...

>>>Now the question: are ST and msdos 720KB diskettes fully compatible? In
>>>other words: can ALL the data of a ST diskette be read using the pc FDD
>>
>>
>> Yes and no :-)
>>
>> There is really no easy answer to your question. If your floppies are
>> standard formatted on TOS 1.04 and higher any pc should be able to read
>> the data. If they are copy protected it will not work easily...
>
>Yes. Once again then: what are those limitations of the floppy
>controller in the ST?

I guess you understand that the format itself and contents of the data
sectors are two very different things. All data sectors can be read, even
those with CRC errors but the format can be made in lots of different
ways.

>>>controler? In that case I could use standard dd on my linux pc.
>>>Otherwise I look for alternatives either for ST or Amiga. I simply have
>>>a bunch of ST diskettes, which I would like archive (and be able to
>>>restore back once) before they get demagnetised...

First keep them write protected. At least Win-95 actually makes changes
to the bootsector of any non Windows floppy and this really happens even
if you only _read_ from the floppy. Will happen if you insert a floppy in
the drive and just open the drive window!

If the floppies are not write protected you often can read them directly.
If they were written by TOS 1.2 or older ther are a few bits in the
bootsector that has to be changed or Windows will have problems. There
are both Atari and Win programs out that can take care of this.

If a format with 10 or 11 sectors/track were used you can use the MSA program on an ST to make a compressed copy of all sector content that can be written back again. I think there are compatible programs under Windows that does the same. The Emulation guys will know...

>BTW. When I mounted a ST diskette it showed strange (garbage) volume
>name. Is this one of the differences between ST and msdos format?

Normally compatible with msdos. Just checked here and it showed up just fine in Win-95 desktop. The volume name is put in the root directory with bit 3 set in the attribute (12th byte in the entry) byte.

There are some other non standard ways... The desktop program Neodesk uses its own way to make it possible to have more than 8+3 charcters in the volume name. It should be backwards compatible, though.

Chris,

Don't pay attention to Barrie. He's just saying that stuff so that he can drum up sales in his business. ($150US for a Marpet kit...give me a break! That's TWICE of the original MSRP!)

I think there is a market for your products.

I would be interested in your kits. The 1 4MB SIMM upgrade looks to be the most useful for me. However, I don't like to desolder all the RAM. It's a lot of work! Maybe the "using jumpers to disable onboard RAM" option should be available. The 1 SIMM upgrade would be useful for people who want to shove a IDE adapter into the case too. I'd like to try it! :-)

Your 1.44MB floppy upgrade is interesting in that there is no leg cutting. A bit high on price, but it looks a lot neater and easier to install. I don't think AJAXs can be found easily for $5US (unless Mark can point me to his secret stash! :)).

AFAIK, there are no RAM upgrade boards that take 1 SIMM - al boards require 4 SIMMS. And all the 1.44MB kits require cutting legs. So I think your products are unique enough to sell.

I think if your products are
priced right and build a good reputation, I think you will sell a few (not 1000s :)). I
think there are a good number of 520/1040STs that need upgrading, but dealers are charging too much for the Marpet boards as stated earlier.

If you're ever bored and run out of projects, I think another big need for the ST market now is a scan doubler (or some type of RGB to VGA converter). While ST color monitors are still in decent supply, they tend to be the Goldstar (terrible brightness quality) or Samsung (break often) models which were not very good quality compared to the 14" Phillips and 12" JVC models. These two excellent models are quite rare. To be able to use the ST color modes on good quality VGA monitors would be a boon. I mean, you could sell more of your game CDs too. :-)

What are the CPU kits you are referring to? The 16Mhz upgrade kits?

Are your projects going to be available for DIYers? Or are you going to sell them commercial only?

Anyway, that's my feedback. Please don't let naysayers and businessmen bring you down!!! We need hackers like you to keep the ST alive!

Hoping you change your mind and stay with us, Phil

P.S. For some reason, my private mail to you bounced at the following address: exxos@home.co.uk.

The problem is room in the case. I was making a board to solder under the PSU to keep it out of the way only problem is as you say unsolder all the ram which is a pain, im still thinking on the best solution for it.

Im not a fan of leg cutting since everytime I try it I normally end up snapping the legs off, my kit you just unsolder the chip, its a lot better ni the end I think.

The Time Capsule CD was given away with the very last issue of AC
(#16), hence could not have been advertised in later issues. All
subscribers to the magazine whose subscription ended with or included
issue #16 should have received a copy of the CD with their magazine.

>I don't even remember seeing it in there without looking it up. fair enough

That's entirely your choice. We closed AC because it started to cost
us money.

First thing to check is whether or not your subscription finished with
an issue before #16. Some people's subs did finish before #16 and not
everyone renewed. In fact I think there was quite a drop in the print
figure between #15 and #16. If you did receive #16 and you didn't
receive a CD, then that's an error.

If you didn't receive #16 and you're sure your sub was current then
again it's an error either on AC's part or a delivery matter. Sadly I
no longer have access to the AC database (Data Protection reasons),
because ownership of Renegade Publishing Ltd passed to Joe Connor over
two years ago.

I would suggest that you contact Joe Connor and see if he can check
your subscription details and possibly find a copy of #16 for you if
you are entitled to one.

> Maybe this explains the 15 you have surplus ??

No, not really. We had to order 1,000 CDs because our final issue of
AC had a print run of about 800-900. The CD pressers use increments of
500.

As far as I am aware there were no real problems with the delivery of
#16. There's usually one or two that go missing in the post, or the
label did not get printed (but that was very very rare). Because of
the way that we posted and paid for the delivery of UK delivered
copies, we were always able to accurately tally up the posted number
of magazines with the database figure, any anomaly would have shown up
within a very short time (believe me the Post Office Revenue
Protection branch were very accurate and stringent in our dealings
with them!!!)

See if you can get some clarification on when your sub to AC finished.
I can happily supply you with a CD upon receipt of a small Jiffybag,
with sufficient return postage, suitably sized for a single CD.

Contact me via email and I'll supply you with a contact address.

The same goes for anyone else here that wants a copy.

If I remember right, Joe passed most of the back issues of Atari Computing
to me at the last Stafford show. I still have copies of issue 16, but sadly
no CDs.

Neck or leg sir,

> That's TWICE of the original MSRP!)

Puffin' Puff, since you quote in dollars I guess English is your second language, how can my post be interpreted as a plug for my business. Chris asked the questions, I gave my considered opinions. I probably lose more sales than gain for speaking my mind. C'est la vie.

When and where did you see the excellent Marpet kit on sale for $150. Not on my site.

> I think there is a market for your products.

For the DIY customer, probably.

For Joe Public wanting a quick, proven upgrade, probably not.

> I think there are a good number of 520/1040STs that need upgrading, but
> dealers are charging too much for the Marpet boards as stated earlier.

Safe to say most of the 520/1040 FMs have been done or people just buy a 4mb ST, that's no secret.

I still have the Marpet board in stock. I will only supply and fit. That way I make a living and the cludgers bother others.

> If you're ever bored and run out of projects, I think another big need for
> the ST market now is a scan doubler (or some type of RGB to VGA
converter).

Ah, something constructive!

> Anyway, that's my feedback. Please don't let naysayers and businessmen
bring
> you down!!! We need hackers like you to keep the ST alive!

Most certainly, but they need to concentrate on something new, not try to re-invent the wheel.

If a hard drive does the job how can it be behind (the required) spec? You
really should realise the largest part of the cost for an external Atari
hard drive is the case, PSU and interface. My drives start at £100 or so for
100mb. You may get a 200mb or 300mb unit depending on my stock. Some have
had 500mb units for the same price. There are no 'spec' prices for Atari
parts, there's no direct comparison.

> I want to bring out reasonable price upgrades. If there are kits
already out there then please
> let me know, would save me a hell of a lot of time if I can just buy them

It is just a screen shot. Scot Sanders refused to allow distribution
as a HYP far as I know.

Read here about it:

Most of my kits will be solder in types. The cost of building plugin boards is more costfull. I dont like plugin stuff though if theres enough call for such things and people are willing to pay the higher prices for the option then I will look into it.

How much are you selling that board for ? are there any online instuctions to how to fit it so I can take a look whats already out there ?

> Ah, something constructive!
>

What people dont seem to understand is project development takes time and cash. The idea is if people buy the smaller projects then it will fund future projects. I could develop such a device though not without some small capital to start with. i've spent a large amount of time and cash already, I dont really want to take on anothe rproject until my current ones are finished. If no one is interested then thats fine. I will have all the stuff I need for my ST!

Closing my site will not be my choice, it is the choice of the Atari users. I vote to keep my site running and keep Atari active. If people support it then it stays open and development carrys on. If people dont support it then the site closes and I move onto other things. Its a very simple choice. I dont really have a say in it, I can't afford by far to develop stuff myself. Buying something from my site helps me pay off running costs and parts I buy. I dont actually make any profit from it. I would do form the CD's which I got in my site. which means I can afford to buy better tools and expand. True I could giveaway stuff but at the end of it I am not keeping the profets it all goes back into development. If people rather complain about it then im happy to let you complain way up until Atari is nothing but a fond memory. users will only have themselves to blame for that so dont blame me for trying to fund what I love doing, which is supporting the Atari sence.

> If a hard drive does the job how can it be behind (the required) spec? You

for todays drives 100MB is nothing, you can buy 2gig drives new for as
little as £20 is you look correctly.

> really should realise the largest part of the cost for an external Atari
> hard drive is the case, PSU and interface.

Interfaces can be expensive, cheapest ive found is about £20, SCSI cases are
well overpriced IMO, Ive not looked much but in local shops they are going
for like £60. I would expect a 2gig drive compleate for £100, If I could
find a source of some good cases I would build the power supply up myself.
I would expect anyone to pay £100 for a 100MB drive, I have a SCSI case with
interface, soon to be a 2gig drive. S/H of course but I would expect anyone
to pay much for it. My kits seems a lot but if people knew what when into
it they would see its really cheap. cheaper by far of some other kits ive
seen. Its a sad fact that people dont know how much stuff really costs. I
know how much a 100MB SCSI drive costs, which is £100 or so on your site,
when its worked out correctly its a fair(ish) price in some respects though
I would buy one since 100MB drive for £100 does not sound good (even though
it probably is). Im not pickinh fault with your prices though I doubt I
will bring out SCSI drives since people wont pay the higher price for them
no matter how much of a bargin it actually is.

> > I want to bring out reasonable price upgrades. If there are kits

> > let me know, would save me a hell of a lot of time if I can just buy
them
> > cheaper than I can make them.
>
> Send me your projected product and price list.

I dont have one. I am guessing that a 16mhz kit would cost near £100, I
doubt anyone would pay that since they could buy 5 whole ST's for that. This
is why I posted here to see what the market is like. I am not going to spend
£100's on development if no one is interested. I am asking what people are
willing to buy at what price. Some people have already said £40 seems a bit
much for a 1.44kit, I agree it does sound a lot, but its a hard fact that
this is what it costs to build. If you work it out roughtly....

£20 in board parts alone, £10 for floppy drive

all minimum times.

1 hour to etch and drill the board.
1 hour clean up and assemble the board & upgrade drive.
1 hour to test fully the board.

this does not include costs for the tools for the job, drill bits break, soldertip wear etc etc. so in all 3 hours to assemble 1 board fully, £10 for 3 hours is not really good at all. It could be possible to build them up if im bloody quick though theres always some problem which takes time, even so £10 for a hours work is not too bad. So I hope you can all can see £40 is well justified. The parts may seem a lot but there not much I can do about that. I buy the cheapest parts but dont buy crap. Unfortunattly parts are expensive and so is developing PCB's!

This is whay again, I ask if people want such things. I would love to seel the kit for £10 as this is probably what people thing such a thing is worst, though its not possible. If people dont see a good value kit at this price then theres no point at all developing things which will cost more than that like Ram upgrades and CPU boosters etc. I would be a fool to spend developing kits which users can do themselves when I can just "bodge fit" stuff in for my own ST to get it working, save me a hec of a lot of time and effort. this is just for a pretty simple kit. If this does not sell then I doubt anything else would.

>
> > Most of the stuff is solder in so I
> > doubt there's enough intelligence out there to do it without buggering
> > summert else up in the process.
>

> There's good and bad but the good, inc the Marpet, are .....good and easy
> enough for Joe Public to fit.
>

If there is a larger call for plugin stuff then I will do it, its not possible to plugin everything without some soldering somewhere. some kits like RAM might be able to do it though it depends on call and how much turn around my site has. I myself would have never fitted a solder in board in my ST. I know what it was like to fear even the thought of a solder in kit. So far there is notmuch interest in my solder in kits, so why would I fund development into plugin kits ? I may not be the best buisness man in the world though spending money for nothing such seems like a waste dont it.

> flib

I used to do a lot of stuff for the ST, like the discmags I did along with
supporting others. Though it had to end sice doing things for fun sadely
doesnt pay the bills. I would love to start doing such things again though
I dont have the time like I used to have :(I used to do a lot of
programming though I moved onto the PC since notmany showed any interest in
what I was doing which is why I moved on. I dont use my ST much, I still
play games on it and one thing which is a pain is the 720K drive, 1.4meg
drive loads quicker and more space for games! some games are really good but
run very slow which almost makes then unplayable. a CPU booster would
readdict me to many games for sure. I hope everyone kept up with that one
;-) I sure can't find anything out there which is what I am looking for at

the right price which is why I thought up the ideas to try my own. I thought I would share my effort with other people also, you can't really shoot me down for that which some other people seem to be half trying to do at the moment. I will still update my ST and I will be happy, every one else can do what they like. Though I am not going to arguee with reasons on why I am trying to help people. If everyone is happy with what they have got or can get then thats fine. I can do what I want to do so everyone is happy.....

Years ago Simarils released a CD version of Ishar with the Atari and the PC versions on the CD.
The cool thing about the CD was you got alot of prerender cut scenes in the Falcon version that
were loaded from the CD. Unfortunately I couldn't find anyone that had it for sale at the time.

A recent auction of Ishar games, made me wonder if anyone out there still had a copy of the CD.

Hello All,

I am trying to read a CVG file under Calamus SL 2002. This file was produced by Porthos. When I try to load it in, nothing happens. How long is it suppose to take for Calamus to bring it up? I waited about 15 minutes. The file is about 630K. I created a vector graphics frame and then imported the file into that. If that is wrong, what is the correct way? Anybody???

What Mark failed to tell us is how he got them, or for that matter its likely a private sale so nobody else can get an ajax chip for $5. Btw, dropping in an ajax chip works great in a mega ste but stuffing one into any of the earlier st's is no easy task.

The last few drives I got were $25 to $35 for a 1 gig drive here in canada.
that 200 quid price translates to a minimum of $210 canadian. For that price
difference I can easily find myself a case, power supply and host adaptor.

It can take quite some time before Calamus brings up the cvg. It all depends of the number of objects the cvg holds. As your cvg is 630K I suspect it's just too big for Calamus. Correct me if I'm wrong, I believe for the moment Calamus is restricted in the numbers of objects it can handle. This will change in future versions of Calamus. I'm only afraid that future versions of Calamus won't run anymore on Atari, even if one use MagiC.
I tried it with a 271K cvg created with Porthos. Calamus SL 2002 R3 needed just 3 secs to display the cvg on screen. This with Cache for vector graphics swichted on. Without the cache Calamus starts displaying the cvg instantly but line by line. Try it once without the cache and see what happens. You can change the cache in options/screen display. I don't know if "screen display" is the right word as I'm using the Dutch version of Calamus so on your version this options may carry another name.

HTH,
Martin

There's nothing to it, one adaptor plugs in under the video shifter chip and the other plugs in around the MMU. There are two (IIRC) resistor legs to cut and lift, and a couple of clip-on leads to disable the built-in memory.

Cheers

Derryck

>don't know!). ;-)

Yes, and the only on topic and relevant ones are from Ben Smith himself!

OK, I have not checked every NG this is crossposted to but at least here
in comp.sys.atari.st there is no charter that would make him OT.

Makes me wonder if those who keep on complaining and asking personal
questions to Ben (ever heard of email?) do this to help getting his
message out...

Even though I'm located far away from Ben Smith I have actually thought
of buying some things from him simply because I'm so pissed by reading
all these stupid follow ups...

The question is not about off-topicness, it's about frequency of posting.

Plus he slams auction sellers, but that's a personal thing with me.

Ok, I agree. It's no use to slam auction sellers in general. There are a few which are really corrupt and haven't heard of customer service at all, but most of them are ok. But I don't think it's reasonable to compare auctions with normal business. I don't think you can expect too much service from an auction seller, since they mostly don't even know what they're selling. If I want to make sure to get a quality product, I'm not going to look for it on ebay.

I'm using NVDI 5.03 and Band In A Box together, without problems.
The only problem I can remember was the MONACO020.FNT that had an "s"
before it in the ASSIGN.SYS file in the standard installation. This would
not look good in Band In A Box. After removing the "s" before this
fontname in ASSIGN.SYS this problem was solved.

You are practically asking him to come back you know.
I must say you can't really complain about his presence one bit
if you post stuff like this.

Just my 2 cents.

Personally I think what has happened is a little too OTT, at the end
of the day Ben makes a living supplying those that read these groups.
Whilst I agree there are those that don't like Ben's posts for various
reasons I don't think tampering with a man's living is quite
justified.

We are not talking a wide open market here, this is quite specialised
and quite possibly the reliance is on these very groups.

Sorry, even tho I don't supports Ben's issue with Ebay'ers and I wish
he would use COMM: or ADV: I would never think of taking steps that
might regulate his income or possibly make him think twice about if
it's all worthwhile.

I don't want to get into a long drawn out 'but he's' thing, this is
just my personal opinion pointed out in a *civil way*..

He may be on topic but he's posting spams so often people want to do
more than killfile him, they want to kill him.

I have his email KF'ed long ago cuz I got tired of seeing the same new
spam almost every other day. :p

Hi Joakim

When he's not around I admit its a relief but he/it always seems to come back anyways. And usually keeps posting the same stuff too. But then its not the only incident of "nonsense" on usenet. Actually its not that I want him / it back but it always happens anyways, he / its been at it years before you or I arrived here, and been back long after others who've debunked him have left.

Hi all,

I am clearing out my project room a bit since I can't move in there! I have complied a small list of items for sale. I have not but a price next to them so I expect some good offers. anything which is not sold will go on ebay. Im giving anyone a chance to get the items here first.

http://www.cps-games.co.uk/salelist.htm

Please only E-mail me with serious offers, I will answer any questios about the items. I will soon update the list when I get other items ready for sale.

Hello,

I would check out B&C Computers or else Best Electronics. You can install a
1.44 meg floppy also. I have heard this will work and that you will be able to
format in 720k but not 1440k.

2451. Auto Booting IDE Drive in Falcon

Newsgroup: comp.sys.atari.st
Date: 2002-09-22 04:11:02 UTC
From: Claude Bourgoin <claude@pivot.net>
Message-ID: <3d8d3f09$1_3@corp.newsgroups.com>
Source record: 32009

Hi all,
I just got a new Fujitsu 2.16GB IDE drive for my Falcon030. I partioned the drive using HD Driver 7, installed HD Driver on the C partion of the IDE Drive. But I cannot get it top autoboot from the hard drive. The drive will boot if I use a floppy disc with an auto folder that contains the HD Driver program.
Does anyone out their know how to get this IDE drive to auto boot? The old IDE drive that I replaced would auto boot.
Thanks for your help.

Claude B.

2452. SCSI or MiNT question

Newsgroup: comp.sys.atari.st
Date: 2002-09-22 04:56:58 UTC
From: Jim DeClercq <jimd@panix3.panix.com>
Message-ID: <amjiiq$6ed$1@reader2.panix.com>
Source record: 32010

I have an external HD I am trying to install MiNT on. It is the first in my SCSI chain, which includes one tape backup unit, two zip drives, one scanner, and a CDROM. The later things all work.

I can format and partition that external drive. I can write a MiNT filesystem to it, and can use a fdck program to tell it is there, but TOS cannot find it. Error -34.

Atari TT030, HDDriver 8. I had a smaller drive in that external box, and that did not have this problem. But it was too small for what I wanted to do. This one is a HP 1.2 gig.

Any suggestions? Please?

Jim

This should work. Ensure that you did *not* change and of the IDE boot
settings with HDDRUTIL. If it does not work without any special settings
try to change these settings as explained in the HDDRIVER manual.

So it works with MiNT, but not without it? Check the partition sizes.
Without MiNT or MagiC the maximum partition size for TOS 3.0x is 512 MB.

Are you refering to singleTOS, as in mint.prg/minix.xfd is not loaded?

I'm using a Falcon030/CT2b. I had to set both the FastRam flags, using the FileInfo cpx. Or else it would crash om my system too. And CT2b turbo doesn't work without NVDI. With NVDI and CT2b B.I.A.B. is very fast. The panel that appears when a song is calculated before playing (drums...piano...bass...) is hardly visible because of the speed :-)

Do you have any other autofolder apps or accs running ? Did you experiment with the order of the autofolder apps ?

It should work. Let me know.

: So it works with MiNT, but not without it? Check the partition sizes.
: Without MiNT or MagiC the maximum partition size for TOS 3.0x is 512 MB.

No, this is with MiNT running. My drive k: is unreadable from the desktop
with MinT running. It is also unreadable from the desktop without MiNT
running because it is too big, and also because it is a LNX partition.
That I was expecting.

Everything else on my SCSI chain works under MiNT or not under MiNT, and
everything on my SCSI chain is downstream from the drive in question. That
would seem to rule out a termination problem.

Freemint 1.15.12, MiNTNP030 running as mintnp.prg.

Have not tried making a smaller partition, to see what happens without
MiNT running. Have not tried any other kernel, either.

Is there something about a drive or its jumpers that can cause this?
There is no available documentation on this drive. It was made by one of
the divisions of HP that no longer exists. And when they stopped existing,
nobody saved copies of documentation. Nobody put a copy in their library.

In short, can one jumper a drive, any drive, to make it act like this?

Or, when the TOS desktop, or Thing, (same results) gets a double click to
open a drive, what SCSI commands go to the drive from HDDriver? And what
response is expected? Command numbers are OK, I can look up the rest.

Jim

Yes it does.

The Asante device's do not work. They have their own proprietary
system. Several people on several continents have banged their
heads against these devices with no luck.

If you can track down a Dayna adaptor those work.

I don't know this by heart and it depends a bit on the drive. Just check
the commands for another drive. You can expect a similar sequence. But I
don't think checks on this level make any sense. Since you were able
to partition the drive (HDDRUTIL displays the correct drive and
partition data, doesn't it?) it's clear that nothing is wrong on such a
low level.
My guess is that it has something to do with the fact that it is a Linux
partition and the MiNT filesystem driver for Linux partitions.

How many partitions are set up?
How exactly did you partition them in the very beginning...before writing a
'MiNT' file system?

What kind of 'MiNT' file system are you trying to install, is this an EXT2,
Minix, or RAW partition type?

The desk top is NOT going to see any of these partitions if:
1. Minix (MIX, MNX, RAW) or EXT2 (LNX, $83, EXT, RAW) partitions will not be
accessable AT ALL unless MiNT is running and you have the proper XFS module in
the MINT/MULTITOS folder, or, if it's a MINIX partition and upon set-up
minix.ttp was told to hide the partition from the normal TOS desktop. In such
cases you will have to go through DriveU for access. Some versions of the
minix.ttp/ext2.ttp offer a flag that hides the partition from the desktop while
still reserving the drive letter. This is so access that is not minix/ext2
aware will not accidentally take out data on the partition There once was a
time it was a very good idea to use this feature of the formatter, and many of
the scripted MiNT installs such as KGMD and KEMD did it by default.

2. If it is either MIX or LNX partition and you do not have the proper XFS
module in the MINT or MULTITOS folder. Do be aware that some modules are very
picky about which version of the kernel you are running, and how all of your
directories, file locks, temp directories, and permissions are set up.

3. HDDriver doesn't try to hook any unrecognized partition type into the GEM
desktop...but being XHDI compliant, another OS on your Atari can often still
see, and sometimes even properly use the partitions even if they don't seem to
exist on your desk top. To force HD driver to properly tie any partition type
that it does not directly support into the system you should study the partition
type dialog. HDDriver likes to know partition types so it can provide proper
information to any part of the system that might need them...even if HDDRIVER
doesn't directly support the partition type, it still likes the correct
information so that software that does support it can correctly converse with
the SCSI Drivers! HDDriver is really good at setting things up by itself

provided all the standards and rules have been followed...however, the rules aren't always clear or don't always get followed...so you must give HDDriver a helping hand.
a. Open HDDRIVER Configure Utility and pull down the "HARD DISK/CHANGE PARTITION TYPE" dialogue. Don't change anything for now! Just see if your 'MiNT' partition is registered as LNX, MNX, MIX, RAW, or otherwise, then cancel out of the dialogue. If no partition types show at all then we've a problem and most likely should repartition the entire drive...see my last comment in this post if this is the case.
b. Pull down the "SETTINGS/PARTITION TYPES" dialogue. Make sure any of the partition types you'll need have an X ticked beside them. If your 'MiNT' partition type was listed as RAW or otherwise not listed (I.E. MNX instead of MIX), then you should enter it into one of the partition type blanks provided, or...if for instance, it registered as MNX but you are positive it is an Atari minix partion, you can go back to the change partition type dialog and change it to MIX. The same is true for EXT2 partition types...if you are positive it is Atari EXT2 then the partition type can be changed to LNX. If you aren't 'sure' just add it to one of the blanks and it should still work okay.

> Atari TT030, HDDriver 8. I had a smaller drive in that external box, and
> that did not have this problem. But it was too small for what I wanted to
> do. This one is a HP 1.2 gig.

The drive size should be no problem...
I don't own a single drive under 2 gig anymore and they all work fine with HD Driver on my Falcon030. Of course one can run out of drive letters pretty fast with several big drives connected and lots of partitions. In such cases, simply disable uneeded drives/partitions for your session.

My usual Falcon 030 disk array is set up as follows:
IBM 20gig IDE, 10 1gig BGM partitions, and 1 10 gig LNX partition.
Seagate SCSI II 2.1 gig with 3 partitions around 600meg apiece.
Seagate SCSI II 1.2 gig with 1 GEM/DOS partition.

At times I've also had Ultra Wide SCSI III drives up to 10gig on this chain as well, with no problems (other than running out of drive letters...which can be worked around).

I did have some troubles installing the EasyMint package to the IDE drive at first. These tips should help you find the problem at hand with your LNX/MNX partition.

1. Make sure you are using a compatiable EXT2.XFS or MINIX.XFS module to the MiNT kernel you are using. There are indeed a lot of combinations that just don't work together. If you are doing a fresh install, I highly recomend starting from scratch with one of the EasyMint installs, and since you have a TT with an 030 cpu, I recommend using an EXT2 partition and a solid kernel with FPU emulation (unless you have an actual FPU)...this way you can be relatively sure that all of your XFS modules, init locks, temp directories, permissions and so forth are all compatable. Trying to mix installs such as KGMD with newer things, (I.E. from the SpareMint archives) can indeed be a challenge, often futile, even for experienced unix gurus. YES, if you currently use KGMD, TAF,

or something else, it IS worth while to start all over with SpareMiNT...as it has much more modern file systems, libraries and kernels...many unix things can now be compiled straight away with no code changes, and there is an ever growing list of rpm packages and updates on the SpareMint server.

If none of this seems to help:
May I recommend that you FIRST check the drive with plain GEM/BGM compatible partitions? There is quite alot of tiny things that can go wrong when you start working with a minix or ext2 partition for the first time. First get out the HDDriver manual and set up your drive according to the partition sizes you want using either GEM or BGM partitions. DO READ carefully, and make sure that if you tweak sector sizes (I recommend you don't even mess with this...let HDDriver figure it out) that they are indeed compatable with the partition size and type you've set up. HDDriver does a good job of automatically setting this up, but I've seen many users who have changed things by repartitioning or reinitalizing and partition and create a mess (such as trying to force a GEM partition that is too big, or forcing a 1gig BGM partition to have a 512 sector size instead of 1024 or larger, etc...).

Once the drive is is visible correctly on your desk top, and surely working properly without MiNT...have your ext2 or minix utility intalize the partition you want. It should not touch any other partition(s). Yes, if you really want, you can set up the entire drive as one big ext2 or minix partition, thoe I highly advise you have at least one small GEM or BGM partition first.

Good luck, and holler if I can help you further.

2469. [MagiC] English Upgrade from 6.01 to 6.2?

Newsgroup: comp.sys.atari.st
Date: 2002-09-22 21:06:30 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <_oqj9.147499$AY5.65191906@e3500-atl1.usenetserver.com>
Source record: 32028

Is there an english upgrade path to MagiC 6.2 yet?
So far all I can find is an upgrade for German version 6.10 and some patches and drop in RSC files at the DDP site. How do I make the jump from English 6.01 to German 6.10 or 6.20 without having to buy an entire German Release?

Is Systems Solutions UK still around? Every www link I've found for them seems to be broken. My understanding is that they are offically the 'English' arm of ASH. Is this still true?

Thanks,
Brian

Derryck,

I've said this before several times to others. That perticular troll has been around for a decade. He / IT always comes back from its "vacations" and keeps spewing bollox no matter if everyone ignores IT or not. But the whole point of my reply was at the other spammer troll who blatantlhy posted a DELL for sale ad in an ATARI group.

No matter how you look at it, the more you care about getting even with
him, the more reason for the troll to keep on coming back for more.
Sure, he might pop in once in a while still, but please don't make it
worse.

Having 2 people writing postings with foul language is only annoying
more people IMO.

2472. Re: SCSI or MiNT question

Newsgroup: comp.sys.atari.st
Date: 2002-09-22 23:46:58 UTC
From: Jim DeClercq <jimd@panix2.panix.com>
Message-ID: <amlkpimcg1@reader2.panix.com>
Source record: 32031

Brian Roland <BJRoland@bellsouth.net> writes:

Thank you for all the advice. I am trying to install MiNT, and do not
yet have a drive u to access. It is a LNX for ext2 partition, and there is
one of them. That far I get. I am, at the moment, trying to re-install
MiNTnet for dummies, and not doing anything different than the first
time, or so I thought. I might be wrong about that.
.
The results are different than the first time, and the drive mech is
different from the first time. I did not have room for a compiler.

And thanks for the note about XFS modules. I will check that, and if there
is not one where you suggest there should be one, I will make it so, and
make it match.

But I suspect that I have a drive meant for a specific machine, and need
to get another one, since this one cannot be made to work. I played with
jumpers until it properly initialized, which left only one jumper in
place. On the other hand, it does not have any suffix on the model number,
so it is more than possible that I made some simple mistake.

I guess I will know that after making sure there is a folder with driver
in it, and after making a singleTOS-readable partition.

BTW, EasyMiNT does not work for me. I have only 4.4 megs free on my boot
drive, and it needs more than that. Thus, it reads files, tries to
re-write them, and fails, lacking room. I need a new, larger internal
drive to run EasyMiNT. But I can run MiNTnet for dummies, and add to it.

I will save your advice, print it out and study it. There is a lot of
information there.

: "Jim DeClercq" <jimd@panix3.panix.com> wrote in message
: news:amjiiq$6ed$1@reader2.panix.com...
: > I have an external HD I am trying to install MiNT on. It is the first in
: > my SCSI chain, which includes one tape backup unit, two zip drives, one
: > scanner, and a CDROM. The later things all work.

: No problem...

: > I can format and partition that external drive. I can write a MiNT
: > filesystem to it, and can use a fdck program to tell it is there, but TOS
: > cannot find it. Error -34.

: How many partitions are set up?
: How exactly did you partition them in the very beginning...before writing a

: 'MiNT' file system?

: What kind of 'MiNT' file system are you trying to install, is this an EXT2,
: Minix, or RAW partition type?

: The desk top is NOT going to see any of these partitions if:
: 1. Minix (MIX, MNX, RAW) or EXT2 (LNX, $83, EXT, RAW) partitions will not be
: accessable AT ALL unless MiNT is running and you have the proper XFS module in
: the MINT/MULTITOS folder, or, if it's a MINIX partition and upon set-up
: minix.ttp was told to hide the partition from the normal TOS desktop. In such
: cases you will have to go through DriveU for access. Some versions of the
: minix.ttp/ext2.ttp offer a flag that hides the partition from the desktop while
: still reserving the drive letter. This is so access that is not minix/ext2
: aware will not accidentally take out data on the partition There once was a
: time it was a very good idea to use this feature of the formatter, and many of
: the scripted MiNT installs such as KGMD and KEMD did it by default.

: 2. If it is either MIX or LNX partition and you do not have the proper XFS
: module in the MINT or MULTITOS folder. Do be aware that some modules are very
: picky about which version of the kernel you are running, and how all of your
: directories, file locks, temp directories, and permissions are set up.

: 3. HDDriver doesn't try to hook any unrecognized partition type into the GEM
: desktop...but being XHDI compliant, another OS on your Atari can often still
: see, and sometimes even properly use the partitions even if they don't seem to
: exist on your desk top. To force HD driver to properly tie any partition type
: that it does not directly support into the system you should study the partition
: type dialog. HDDriver likes to know partition types so it can provide proper
: information to any part of the system that might need them...even if HDDRIVER
: doesn't directly support the partition type, it still likes the correct
: information so that software that does support it can correctly converse with
: the SCSI Drivers! HDDriver is really good at setting things up by itself
: provided all the standards and rules have been followed...however, the rules
: aren't always clear or don't always get followed...so you must give HDDriver a
: helping hand.
: a. Open HDDRIVER Configure Utility and pull down the "HARD DISK/CHANGE
: PARTITION TYPE" dialogue. Don't change anything for now! Just see if your
: 'MiNT' partition is registered as LNX, MNX, MIX, RAW, or otherwise, then cancel
: out of the dialogue. If no partition types show at all then we've a problem and
: most likely should repartition the entire drive...see my last comment in this
: post if this is the case.
: b. Pull down the "SETTINGS/PARTITION TYPES" dialogue. Make sure any of
: the partition types you'll need have an X ticked beside them. If your 'MiNT'
: partition type was listed as RAW or otherwise not listed (I.E. MNX instead of
: MIX), then you should enter it into one of the partition type blanks provided,
: or...if for instance, it registered as MNX but you are positive it is an Atari
: minix partion, you can go back to the change partition type dialog and change it
: to MIX. The same is true for EXT2 partition types...if you are positive it is
: Atari EXT2 then the partition type can be changed to LNX. If you aren't 'sure'
: just add it to one of the blanks and it should still work okay.

: > Atari TT030, HDDriver 8. I had a smaller drive in that external box, and
: > that did not have this problem. But it was too small for what I wanted to
: > do. This one is a HP 1.2 gig.

: The drive size should be no problem...
: I don't own a single drive under 2 gig anymore and they all work fine with HD
: Driver on my Falcon030. Of course one can run out of drive letters pretty fast
: with several big drives connected and lots of partitions. In such cases, simply
: disable uneeded drives/partitions for your session.

: My usual Falcon 030 disk array is set up as follows:
: IBM 20gig IDE, 10 1gig BGM partitions, and 1 10 gig LNX partition.
: Seagate SCSI II 2.1 gig with 3 partitions around 600meg apiece.
: Seagate SCSI II 1.2 gig with 1 GEM/DOS partition.

: At times I've also had Ultra Wide SCSI III drives up to 10gig on this chain as
: well, with no problems (other than running out of drive letters...which can be
: worked around).

: I did have some troubles installing the EasyMint package to the IDE drive at
: first. These tips should help you find the problem at hand with your LNX/MNX
: partition.

: 1. Make sure you are using a compatiable EXT2.XFS or MINIX.XFS module to the
: MiNT kernel you are using. There are indeed a lot of combinations that just
: don't work together. If you are doing a fresh install, I highly recomend
: starting from scratch with one of the EasyMint installs, and since you have a TT
: with an 030 cpu, I recommend using an EXT2 partition and a solid kernel with FPU
: emulation (unless you have an actual FPU)...this way you can be relatively sure
: that all of your XFS modules, init locks, temp directories, permissions and so
: forth are all compatable. Trying to mix installs such as KGMD with newer
: things, (I.E. from the SpareMint archives) can indeed be a challenge, often
: futile, even for experienced unix gurus. YES, if you currently use KGMD, TAF,
: or something else, it IS worth while to start all over with SpareMiNT...as it
: has much more modern file systems, libraries and kernels...many unix things can
: now be compiled straight away with no code changes, and there is an ever growing
: list of rpm packages and updates on the SpareMint server.

: If none of this seems to help:
: May I recommend that you FIRST check the drive with plain GEM/BGM compatible
: partitions? There is quite alot of tiny things that can go wrong when you start
: working with a minix or ext2 partition for the first time. First get out the
: HDDriver manual and set up your drive according to the partition sizes you want
: using either GEM or BGM partitions. DO READ carefully, and make sure that if
: you tweak sector sizes (I recommend you don't even mess with this...let HDDriver
: figure it out) that they are indeed compatable with the partition size and type
: you've set up. HDDriver does a good job of automatically setting this up, but
: I've seen many users who have changed things by repartitioning or reinitalizing
: and partition and create a mess (such as trying to force a GEM partition that is
: too big, or forcing a 1gig BGM partition to have a 512 sector size instead of
: 1024 or larger, etc...).

: Once the drive is is visible correctly on your desk top, and surely working
: properly without MiNT...have your ext2 or minix utility intalize the partition
: you want. It should not touch any other partition(s). Yes, if you really want,
: you can set up the entire drive as one big ext2 or minix partition, thoe I
: highly advise you have at least one small GEM or BGM partition first.

: Good luck, and holler if I can help you further.

: Brian Roland

Yes, you can put your MiNT relevant partitions on any drive/partition you wish.

In the case of MiNT, you needn't change anything with boot sectors and such.
First simply make a back-up of your AUTO folder. Then, simply make a directory
called MINT on your normal boot drive as is. Place in the MINT folder your XFS
and XDD modules, and a text file called MINT.CNF.

The minix or ext2 partion(s) can be on your external SCSI drive. You simply
tell MINT.CNF what drive letters to get things it needs from.

I never had good luck with the ext2 installer with this package. In fact, I
never got the package to install on my Falcon unless I opted for minix instead
of ext2.

> The results are different than the first time, and the drive mech is
> different from the first time. I did not have room for a compiler.

You'll have plenty of space for EasyMint now :)

No, I do believe your drive is most likely okay. I also had problems with
MiNTnet for dummies. Something about the XFS module and MiNT kernel in the kit
didn't want to work on my Falcon.

> I guess I will know that after making sure there is a folder with driver
> in it, and after making a singleTOS-readable partition.

Remember, you do not have to devote an entire hard drive to ext2. Only a single
partition...

Yes, do test out the big SCSI drive with regular partition types first.
Partition it with HDDriver as BGM type partitions to begin with. When you run
the ext2 formatter and give it the corresponding drive letter, it will convert
the partition to ext2 without touching any other partitions or drives, and it
should also flag the partition type as LNX.

> BTW, EasyMiNT does not work for me. I have only 4.4 megs free on my boot

It isn't really necissary for you to buy any new internal drive at this time. You should have space a plenty for most things Atari given that new external drive.

Adding to MiNTnet for dummies isn't as simple as it seems. I honestly think you will save yourself many troubles with this next tip.

1. Using HDDriver, divide your big SCSI drive into two or three BGM partitions.

2. Use the fresh space on the first partition of your external SCSI drive to launch the easymint setup, and have it install the ext2 partition on the last partition.

If you really really need more ext2 space later on, you'll have easymint already installed and can convert that first BGM partition to ext2 as well.

You can also boot from any BGM partition because HDDriver allows you to press the key letter of the drive you wish to boot from during startup.

Brian

> 1. Using HDDriver, divide your big SCSI drive into two or three BGM
partitions.

P.S. I almost forgot...as Uwe pointed out...
It's a good idea to keep BGM partitions 512mb or smaller so TOS can also see them. Using HDDriver to divide the drive into 3 or 4 equal partitions should do the trick, and also give you space for things non-mint as well :) If you want/need more ext2 space, you can always convert more partitions later and use unix links to make it act like one continuious drive. 512meg is quite a healthy amount for an EasyMint install including Xwin11 and MORE!

How does this apply to Atari exactly?! You need the xine-d4d or xine-d5d plugins which handle the css. Or I believe you can go the alternative route of ensuring libdvdcss (I think), libdvdread, and libdvdnav are installed using special compile time options. Solaris should come with its own nice software dvd player if the workstation came with a dvdrom drive.

Hi All!

We have the .HYP version and we are still correcting the error in it.
Scott Sanders have prohibited us any kind of distribution except for
errata files. Finaly he also said, after about 2 years of communication,
that he is about to publish the book on the WEB lastly I've been able to
exchange mails with him. After this mail his mailing address doesn't
work any more and I can't find any contact to him anywhere. So for the
reason I don't have a confirmation for the HYP distribution I can't
share it.

There is definitely a change of getting it, but it is not public. And
believe it is the most widely used .HYP on my setup. ;)

best regards

>RAM.

Back to this subject after a while... my 8MB alt-ram board is working quite
fine now (which gives a very nice new feel to using this megaST), but I am
not sure if I installed FRB properly, so I would appreciate some help.
Basically, the sequence I used is:

... mxalloc(65536L, 16384) ... set cookie ... maddalt ...

From some docs on TOS which I have in German (the language I understand
just a little) I concluded that if mxalloc is called with "mode" argument
equal to only bit 14 set (=16384), it should allocate area in ST-RAM which
would not be released upon termination of the program, but handed over to the
system. But is this the correct way? I noticed that Lacescan happily creates
the new screen right over the FRB which was supposed to be reserved.
Should I do it differently? perhaps something like:
.. malloc ... set cookie ... maddalt ... ptermres ?
or else locate it right below memtop and then lower the memtop (assuming that
the ram-declaration program is called immediately upon startup)?

Btw. should a variable at $5A4 which contains "end of TT-style fast-ram"
be set? - probably not, because the starting address is not on "tt-style"
location either, but at $600000 ?

Thanx in advance;

Djordje

Hi Jim,

JD>Or, when the TOS desktop, or Thing, (same results) gets a double click
JD>to open a drive, what SCSI commands go to the drive from HDDriver? And
JD>what response is expected? Command numbers are OK, I can look up the
JD>rest.

Have you all partitions, specially the TOS partitions, made active with
NEWFATFS in mint.cnf? The TOS partitions are not found, when they are not
active with NEWFATFS.

Johann

>German 6.10 or 6.20 without having to buy an entire German Release?

Hi Brian!

I don't think you can - ASH charge for this upgrade. The only free
one is from 6.10, *not* 6.01.

>Is Systems Solutions UK still around? Every www link I've found for them seems
>to be broken.

The Atari side of the business has been taken over by Atari Workshop
which is (or was) a subsidiary.
E_mail: info@atari-workshop.co.uk
Internet: www.atari-workshop.co.uk
Tel: +44 (0)1344 890008

> My understanding is that they are offically the 'English' arm of

Well, AW are the distributors for most ASH products, but not
really an 'English arm'.

I need help to identify a monitor that I just brought. It has an Atari
lable on the front but no other identification except what I think is a
serial number 900 001100 (on the rear)

The plugs on the rear are from left to right

RGB1/Analog DB25
Audio out
Audio in Left and Right RCA
Luma and Chroma RCA

There is also a 3 position sliding switch with options GRN, RGB and VIDEO.

Anyone know what it is ?

Thanks
Tony.

If I had to make a guess I'd say it was a recent RGB monitor for a Falcon?
This is a rather uneducated guess ;)

I suggest that as soon as Scott publishes it on the web then (as long as
it isn't pay to read), then it becomes public domain?

Worth a try anyway!

Is there any move towards updating Blyp BTW? It's a very useful utility
:-)

Cheers

I believe that once you've installed NVDI to 5.02 or 3 on your Mac you
will find that you will be able to print to the current Mac printer from
within MagiCMac.

Cheers

Thanks Brian for the advice! Actually, I've another things to do before
install easymint... The SCSI HD was an old one from the Mac, and I
forget that I need to reformat with Atari; Obviously MultiTOS and AHDI
don't recognize it. I need to buy HDDRIVER 8 ?

Thank you again :-)

S'cuse me butting in Peter, I should have mentioned in my earlier reply that although the English resource files and such on my web site give English menus to most of the MagiC 6.20 installation, there is some German text in the MagiC RAM file and there are two bytes which need changing to have it report to the system that it is an English OS. This affects some utilities which use this value to decide which language to use for its interface etc.

Cheers

Source record: 31951

After reasearching the various aspects of this effort, such as a case, LCD display, motherboard, and CD-ROM drive, it has come to my calculation that the price is WAAAAY too expensive. I was figuring a retail cost of no more than $400 for this device, but so far the cost to simply *BUILD* this thing... (drum roll, please)...

US$735.00!!!

And that's assuming a quanity of 500 of each part (and thusly 500 "machines" in the process).

I seriously doubt ANYONE, ANYWHERE, regardless of name brand loyalty, or otherwise, is going to do anything but laugh their selves out of thair chair and onto the floor over this one.

But I did try...

Latre!

I've dropped most of the strong language when dealing with him. for a while I did use it to get the point across to him in terms he could understand. Now I just laugh at him / It. for annoying people there have been some far more annoying things that gone on here besides tifkas and the responses it generates. My question to you is this: If you dont want to here from him why are you thinking about him / it so much? Now that he / it's gone on another vacation from this group I've certainly found other things to keep me busy, why cant you?

Yes, I have the the English manual. Nice job. I am starting to look through it. I know there are tons of things that Calamus will do that I have not taken advantage of.

I tried making a CVG file using Porthos and Calamus actually loaded them in. The one problem was that when Porthos make the file, it not only included the PDF page I was trying to copy, but also part of my desktop. Not sure what to do, but I have some ideas.

2501. Long Files names on the Falcon

Newsgroup: comp.sys.atari.st
Date: 2002-09-25 07:30:43 UTC
From: Todd Gill <thgill@adelphia.net>
Message-ID: <DCdk9.1560$m92.343813@news1.news.adelphia.net>
Source record: 31957

Hello Everyone!

I am a new Atari User and although I have a ton of questions about various items, the one that bothers me the most is in regards to file name lengths.

I am mostly use to the Amiga and it's ability to handle long filenames and I am curious what I can do on my Falcon to be able to display these long file names? I have a bog standard 4 meg Falcon with TOS 4.04.

Would this require software upgrades or a different OS? I would like to be able to view some of the module music I have on disc's from my pc, but seems I am stuck with 8.3 filenames. Any affordable way to deal with this?

Also, one other question.

How worthwhile is a FPU on a Falcon? Does much software take advantage of it?

Thanks!
Todd

Um - no. The ROM TOS <=4.04 only supports mode 0-3, other modes cause
undefined (and I mean really undefined, in the sense of "using uninitialized
variables") behaviour.

You have to leave your program using Ptermres() to keep memory resident,
otherwise, Gemdos frees all allocated memory on Pterm.

>Btw. should a variable at $5A4 which contains "end of TT-style fast-ram"
>be set? - probably not, because the starting address is not on "tt-style"
>location either, but at $600000 ?

Correct, you should not set that one, since the start is assumed to be at
$01000000.

I use Newsie regularly, with no problems. However, it seems to have a
limit of around 500 articles in a group and then, if you don't delete
some, odd things do happen when trying to download for offline reading.

If you've been keeping lots of posts, try deleting some.

Hi Rob,
I have Notator Alpha, if you're interested. The case describes it this way,

"NOTATOR ALPHA turns the Atari ST into a complete composing workstation:
recording ideas from a MIDI keyboard onto 16 tracks with notes
simultaneously appear[ing] on the screen, altering these notes while
listening to the result, assembling segments in any order to make a score,
printing out music, both score and parts. The idea becomes both music and
score."

I have the original program disks with manual and dongle in the original
case. Let me know if you're interested.

Hi Paul,
Emptied the Post, Offline boxes and XOVER.TXT. Same result!
I should mention that I get 330 out of 850 with comp.sys.atari.st and
500 from other groups. I used to get what was available (max 1000).
I'll ask my ISP if the NG has a download limit.

It would appear so. I would suggest killfile'ing them both,
but you at a disadvantage with newsie. That sucks. If you could manage
a minimum mint-net installation and pine, you'd be all set.

This is to be expected...
The "ENGLISH" versions that I have PURCHASED over the years also have lots of German still in them as well. Heck, 6.01 even shipped to the USA without any USA keytab! I could be wrong, but I think it was not even a UK keytab...but a German one. Some kind person (Was it Dan?) donated a partial keytab so we could use the ENGLISH version at all.

> I am mostly use to the Amiga and it's ability to handle long filenames and I
> am curious what I can do on my Falcon to be able to display these long file
> names? I have a bog standard 4 meg Falcon with TOS 4.04.

Two Ways I know of...

1. Use a MiNT kernel that supports VFAT. You can also set up full scale unix
Minix or EXT2 type partitions with all the kittles and bits for file permissions
and links etc...

2. Use a recent version of MagiC...
MagiC supports VFAT type long names.

The main thing to be careful of if you go making long filenames on your
partitions...
Before you run any hard disk optimization software...make SURE it supports your
type long filenames (I.E. VFAT). If you have older software such as Diamond
Edge...it can wipe out your long file names if you aren't careful. Best to
switch to something newer.

Just my personal qwirk...
I do my best to keep at least my boot partition pure all Atari compatable. I
also keep a large plain jane 8X3 standard ahdi compatable partition around just
in case something like CueBase Audio doesn't like the new stuff.

> Would this require software upgrades or a different OS? I would like to be
> able to view some of the module music I have on disc's from my pc, but seems
> I am stuck with 8.3 filenames. Any affordable way to deal with this?

Provided the software you wish to run is happy under MiNT...then no...you need
not purchase anything.

MagiC is commercial...so if you want to try that...yes, you will have to buy it.

> Also, one other question.
>
> How worthwhile is a FPU on a Falcon? Does much software take advantage of
> it?

If you plan on installing late MiNT kernels and doing anything unix like...it is
probably worthwhile.

If you use Photoline, it is worthwhile. ESPECIALLY on an unaccelorated Falcon (AfterBurner 040, CT1, CT2, CT060, etc...)

If you plan on using heavily any software that has an FPU version then yes, it is worth it.

Otherwise...you can easily get by without it. Most Atari software comes first in a non fpu version. If offered, the fpu version does offer a nice boost.

On the Unix end of things...
In most cases you CAN get by with either no FPU, by tweaking some compile time variables, or by using software FPU emulation. The nice thing about having an FPU in this realm, is that you can often just grab an rpm file, or other unix source distribution and have much greater chances of it working without tons of CPU overhead and code changes. Of course...software that does indeed do floating math in the unix world will greatly benifit by an actual FPU.

If you are interested in checking out EasyMint, and SpareMiNT (A unix like system) then I would highly recommend all the memory you can get (14meg Max on a Stock Falcon), and an FPU. Oh, and I do happen to have a spare Bog Atari Falcon 030 14meg memory board laying around. It's too slow for my CT2b, so I'll let it go for $40, and I'll pay shipping (if you are in the USA).

>
> 2. Use a recent version of MagiC...
> MagiC supports VFAT type long names.

Oh...I forgot something...
You'll also need at least a file selector that can see long file names, and
you'd also benifit by a desktop that can see them. Otherwise, you're going VFAT
for no good reason.

If you go the MiNT Route...
You'll need an AES.
4.1 can be had for free, but does not see long file names.
XAAES can be had for free, but it does not include any desk-top.
N.AES is commercial, and includes a version of Thing Desk top (but this Version
of Thing only runs with N.AES).

Freedom2, and BoxKite are file selectors that can see long file names.
I'm thinking Freedom2 is freeware?
BoxKite is Shareware. These file selectors add a plethora of handy features in
addition to the long file names.

Thing is a very good DeskTop that can see long file names. It is ShareWare.
The Demo works very well...you'll just get nag dialouges and see "UNREGISTERED"
checkers all over your screen.untill such time as you enter a valid key.

MagiC's included Magix Desk and file selector can see long filenames.

Jinee Desk Top (sp?) can see long filenames (commercial from ASH).

Note: If your desktop and or file selector can not see long file names, then in
most cases no harm is done...you just see the 8.3 DOS like listing (THISIS~1.TXT
for ThisIsALongTestFile.txt).

Hope this sheds a little light...
Brian

Or use Newswatch in combination with Newsie. Never tried myself, though.

On the other hand Newsie can't handle ï¿½ï¿½ï¿½ and other important characters
so it is only usable in English newsgroups.

The only German text that I can think of is that which appears if some screen drivers cannot be found - the one that says that the system has been halted and MCMD will be started (which is odd, as it isn't!).

>USA keytab! I could be wrong, but I think it was not even a UK keytab...but

I'd be surprised if you didn't get a UK table, but I'd hazard a guess that there would only be a couple of problem keys involved. There is a utility (whose name escapes me) that allows you build your own key mapping, and there is also the Keytable utility to load different maps.

HPOptimizer V2.9. It can be downloaded from the MISC section of my web site.

It is the ONLY repair/defrag utility that is safe to use on a LFN system (there
is a MiNT version as well).

Always make a backup first for safety, of course.

Cheers

True enough, but this built in AES will not multitask...
The built in desk top will not see long file names...

The free XXAES is quite good for most things, and the unregistered Thing Demo is very adequate for seeing how he likes things.

> Or to convert them to a format that can be played ?

I seem to remember a ttp decoder that was released a while back that could, but Real Audio has upped versions (and compression formats) several times since then. I can't seem to find it online...but it's bound to still be out there somewhere.

http://www.dhs.nu/files_msx_players.jsp;jsessionid=NFIDFEBCIHCE
Check out these players...ShoutCast and MP2/3 are definate possibilities... Thoe you'd better hurry and get an MP3 player while you still can! (hopefully the mp3 plugin hasn't already been removed)

Now, is this person talking about Real *Audio* or *Video*? I've seen video
clips that use the *.rm extension. This is one thing I have not seen
supported in any Atari software as of yet.

Hello John,

That is strange. Newsie never did that to me. I think it is a setting problem with Newsie. Check them. You may also want to switch to Okami. I did and am very happy with it.

It depends on what do you use this machine for. If you are heavily into CADD,
3D-graphics (animation, raytracing), fractals, or some scientific computations,
a FPU will speed the relevant operations from 5 to 15 times. For some other
applications a FPU is practically unimportant. And, as far as I know, main
3-D graphics and CADD applications support the FPU.

Well, why not. It is not likely that one would be able to get any profit
from a project like this (although at one time I contemplated swapping
my projects for some software items I would like to have), so I may as
well publish it. In a few days I may post a short description of the project
in comp.sys.atari.st.tech. I will then draw the final version of the
schematics, write some instructions and post it, together with some other
hardware hacks, to some convenient location (I don't have a web page and
curently am not much inclined to maintain one).

>memory upgrades, CPU accelerators and video cards are all much-needed IMHO.

As for my next act... :) for some time I have been thinking of an upgrade
consisting of a 10MHz accelerator (complete board, not just CPU), containing
also a 800x500 ST-high resolution enhancer- done with several standard ttl
chips. So, maybe some day...

although, working on this RAM board I found out that my eyesight is not
anymore what it used to be; such creative exercises may become difficult :(

The query wasn't about multitasking, but about long filenames.

> The built in desk top will not see long file names...

Adding a new AES will not correct this. He needs a new desktop or a new
file selector. Better stil, both of them.

The file selector with XXAES does indeed see long file names.
As does N.AES's file selector.
So yes...adding a multitasking AES does offer a solution of sorts.
Both of these can also run without a desk top...

The relevance to the thread are options that he can use to gain the advantage of long file names, and yes, you are correct. The built in desk top can be launched with MiNT, and he will need a replacement file selector to see his VFAT long file names. But still...it is not a multi tasking AES...just a little extra info for his information.

800*600 you mean? I guess that this upgrade won't fit inside the ST case?

>although, working on this RAM board I found out that my eyesight is not
>anymore what it used to be; such creative exercises may become difficult :(

I hate to admit that I must wear reading glasses for such work :-(

If you're into SMD devices you can expect to have to use a microscope!

Cheers

I cut the cross posting. And I'll reply here, rising to the bait.

I can't imagine how stilted the voting must have been to come up with the
idea that in the entire history of Atari games that the game voted #1 is the
best of all. To be honest with you, when my friends and I played it as kids
it
kept us entertained for about a week and then we were right back to the
cool games we had been playing. Combat got about 1000 times more playing
time
in my circle. And I definately would NOT classify Combat as the #1 atari
game of
all time.

Just my 2 cents (and I know you wanted people to post in your forum)

Dan
aka baldrick

I thought ADVENTURE would be at the top when I began to read the list;
one of my favorites. I too was pleased with the list and pretty much
agree with it. I wouldn't have PONG or COMBAT on my list of
favorites, but their contribution to the 2600 world definitely merits
their inclusion.

Nice! I personally would have put Space Invaders over Asteroids, but that's
just me ;^)

#1 was right on IMHO.

Tim

I would like to thank everyone for their assistance with my questions. Since my Falcon is mostly a hobby computer for me, it would be silly for me to pour any mad amount of money into it. But I see at least few applications out there that I will be most likely buying.

When I have more time free this weekend I will investigate looking into Mint.

Thanks!
todd

No, No, No, No, NO! I mean, of course, Space Invaders at #11!

For the 2600 only, it should darned well be right near the top of the heap.

For other Atari systems (5200 & 8Bit), it should be in the rubbish bin!

Cool list, and I *loved* the Warren R. comments about the game. (What about doing a top 20 of 2600 games?)

Dane.

To be honest, the list was not limited to games produced *by*
Atari, or games that made their first/only debut on Atari systems.
Having diluted the list thus, its a bit much to defend Pong's
place on the list on the basis of it being an Atari production.
That it heralded the age of the video game arcade, and home
video game console, *thats* justification. That it was produced
by Atari, or was a landmark unique in Atari's history - if
those were criteria, you'd have to remove a couple of the arcade
games listed, as well as Dungeon Master (which was first on
the Atari ST, but not made by Atari, and with the Amiga release
soon after hardly unique to the Atari or even best done on it).

Hi Hallvard,

>Still, there *is* a printing option in my version of MagiCMac, so there
>should be some way of making it work with what I already have, even if I
>don't use NVDI for it, right?
>But how?

Dig out that MagiCMac manual.... ;-)
Sit back... it's going to get quite complicated !!
NVDI is always needed... it allows to print under MagiCMac using the Mac's native printerdriver. Since MagiCMac 6.01 synchronous printing with Epson Color and Photo printers using the native NVDI drivers is supported. But since your version of MagiCMac doesn't support this, your only option is to use the Apple QuickDraw output driver, the drawback of this is that you're limited to printing in maximum 360*360 DPI.

NVDI is capable of catching the XBIOS and GEMDOS calls (use the seperate nvdi preset.prg), when this feature is selected, printing from apps that depend on GDOS for printing will be passed on to NVDI, on the mac NVDI will pass it on to QuickDraw...
So, in practice GEMDOS and GDOS printing is supported under any version of MagiCMac.

Printing from programs with generic printer drivers is not supported under any version of MagiCMac unless you use the Mac Powerprint interface. New printers connected to the USB port are not supported by the NVDI native drivers either, even if you select a native NVDI driver, printing will always be passed on to Apple QuickDraw.

The first thing you need to check is if Apple QuickDraw is installed on your Mac....

hey, I told you that this was going to get complicated.... :-)

Cheers from Belgium
Dennis

Hi Hallvard,

>I have MagiCMac 2.1.1. (MagiC 5.11) and I've selected "Printer port" in
>the "PRT" option (within MacOS, the "Options" -> "System parameters"
>window. When I close the window and open it again all I get is "PRT: Not
>in use". Strange.

This is a bit confusing, but you should select "Not in use" from that
dialog, in the printer menu you should select "printer port" and set the
speed to "230000" (this only applies for versions of MagiCMac up to 2.2.2),
NVDI *must* be set to "QuickDraw Output". Do *not* select a Epson native
driver in the NVDI printer setup....

>I've also got NVDI installed (WNVDI 4), and was hoping that I would be
>able to work it out with this, but no go. Any tips anyone?

When you set up the printer like I suggested above NVDI will use the native
Epson Mac printerdriver which is much better then the one supplied with
NVDI. But do make sure to reserve room for a spooler that's at least 150Mb
large, although NVDI uses the Mac driver, it doesn't use the Mac spooler.
That's about all there is to it...

>I just tried it with Papyrus on the Mega STe, wondering if it would
>print in colour, which it did!!!

Make sure that you select NVDI as printer driver, the generic Papyrus
drivers won't work under MagiCMac. You can print under MagiCMac via GEMDOS
and GDOS, generic printer drivers however are not supported...

Cheers from Belgium
Dennis

That wasn't the answer to the question I asked. Would you put Pong on a list of the all time great Atari games, or not?

As for the non-Atari products... Atari DID create both Space Invaders and Ms. Pac-Man for their respective systems. The voting was open to any game that appeared on an Atari system. Which is why SI, Ms.Pac, and DM are on the list. (BTW, the list does penalize them for not being originally created by Atari.)

Hi, I'm Ben Smith of Bravo Sierra Computers! Your Benefactor, an Atari Dealer. Offering Sales, Support & Service of Atari HardWare, SoftWare, Books & Accessories for the Classic Atari 8 Bit and Atari ST Computers plus the 64 Bit Atari Jaguar Game System. I am a Reseller of Used & New Atari Collections! Much of which were the Treasures of Former Atarians, Locked away in Dungeons, now given New Lives, offered to be sold as New found Treasure, back in Circulation in the Atari MarketPlace. Hidden and Forgotten, Now set free from the secret hiding places. Atari Heaven where former Atarians had left them to Die. Saving Wondrous Collections from being irretrievably Lost! As well as Saving entire inventories from defunct Atari Dealers, much of it +NEW in the BOX/BAG! After Languishing in Forgotten Warehouses, long abandoned by retired Atari Dealers!

I love saving my customers money! I mainly use Postal Delivery! I save money for my customers when using Postal 2-3 Day Priority Mail & Global Priority Mail. I use Packaging supplied by the Post Office for free and Pass on the savings. I sell Atari, I'm not in the Business of Profiting from Marking up on the cost of Shipping! And just like the Postal Service I avoid making promises I cant keep. The Post Office sends Packages by 2-3 Day Priority Mail. They don't promise 2-3 Days but they have a Good record of Following through! Once I receive payment, your order usually goes out the same Day! This is not a Promise, but like the Post Office I have a Good record of following through! Ask my Customers! I also have Libraries of Reference Books for the Classic Atari 8 Bit and the Atari ST Computers! I have ways of saving Money on Postage by Sending it Book Rate. I also have some tricks for saving on Postage when Mailing outside the United States! I Ship Atari anywhere the Law allows! If you dont come to me, I cant save you any Money!So check my HotLinks below, E-Mail me at atari@aracnet.com or call Ben anytime at (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

Got Atari Questions? E-Mail or Call Ben 24Hrs, anytime at (503)256-9974!

Indeed one can use Newswatch to retrieve messages from Usenet but like
Edward says, use Okami instead of Newsie. It's far beter then Newsie.

CU,
Martin

Hi Martin,
I've been having good luck with Newsie untill just recently. I would
like to find out why the numbers don't add up anymore! In the mean time,
I got Okami 2.0 which seems to need a little set-up work.

2575. APE-like software for Atari STf?

Newsgroup: comp.sys.atari.st
Date: 2002-09-29 07:46:18 UTC
From: michaelgale@sympatico.ca
Message-ID: <3d96add1.8000694@news1.on.sympatico.ca>
Source record: 31935

Hi,

I enjoy the software program entitled A.P.E. very much
(http://www.atarimax.com/) when I use it in conjunction with my Atari
800 XL. Could someone tell me if a similar programme exists for the
Atari STf machines? A.P.E. has a lot of features, but I suppose the
only requirement I would place on the Atari STf version would be
support for loading applications from my PC and running them on the
Atari (just like A.P.E.).

Thanks for any information you can provide.

Michael

>calls, avoid lineA (although they work great on the ST) and such
>guidelines.

Yes. And the most interesting thing is, that many of them, for example
linea, are just shortcuts. Linea usage means just shortcuts to the VDI
screen driver. So you do not have really a benefit. You need to set
parameters in the needed VDI variables and thencall the specific linea
call.

I did see this all while coding in EmuTOS' vdi and converting many of
the assembler written stuff to C. Interestingly these assembler
routines are more or lsee the ones Atari then got one day from DRI -
they are mostly the same.

Ken,

I just bought 100 in 10 very nice solid "flip boxes" of 10 disks, complete with labels for £2.00. (i.e. about 4 dollars) at a Radio Rally. For those of you in the U.K. the sellers were the Computer Junk Shop in Widnes. (tel 0151 520 6671) and they had thousands.

They also had 5.25 inch real floppies which they were giving away....

Ken

They are pretty damned rare to find new and boxed in a commercial store now around my way (London). I bought some locally about 2 years ago and they were 7 ukp for a box of 10. HD disks are plentiful and go for as little as 3 ukp for 10. I have an email address for a bloke that sells used DD disks by mail order if you are interested. I'd say there was still a small market in them as there is still a fair amount of gear of one kind or another that only take DSDD disks although many now accept both DD and HD disks.

Cheers
Al

Not really (at least not for an average person with normal eyesight). I have soldered 0.5mm spacing QFP parts (on a Milan board) with only a normal illuminated magnifier lens.

I agree that a microscope is nice for 0.6mm and below, but normal SO packages (ie. 1.27mm pitch), and 0805 or 1206 discretes require only normal hobby equipment and a steady hand. I remember soldering 0.635mm QFPs on a home-etched PCB.

So yes, a magnifier or microscope is great, but you can achieve a lot without them on a hobby level, and there is no reason to think that you need not even start if you do not have access to such equipment.

Hmm, is Vezz's site still maintained? It is rarely mentioned anymore, and
I admit I haven't visited it for a long time. But in fact, at least one
of my hacks is there (a FPU board), and possibly also a HD-floppy adaptor.

>>As for my next act... :) for some time I have been thinking of an upgrade
>>consisting of a 10MHz accelerator (complete board, not just CPU), containing
>>also a 800x500 ST-high resolution enhancer- done with several standard ttl
>
>800*600 you mean?

No, i mean 800x500, i.e. 25% more in horizontal and vertical directions;
well, maybe not exactly 500 vertical but 512 or something like that. The idea
is to be able to continue to use SM124 monitor. If system clock is raised
from 8 to 10 Mhz (25%), about 25% more pixels can be squeezed into one
scanline (assuming that appropriate 35.7KHz horizontal sync is provided)
giving a horizontal resolution of about 800. But SM124 has a more-less
fixed ratio of horizontal and vertical frequencies (within the locking
range), and nominal vertical sync frequency is about 500 times lower than
horizontal one, so that there can only be about 500 scanlines (or somewhat
more) in the picture. In order to get a vertical resolution of 600 lines,
I think that one would have to slightly modify the SM124, in order to lower
its vertical sync frequency, probably by increasing a capacitor value in the
vertical circuit. The problem is that for 600 lines the vertical scan rate
would have to go below 60Hz, which may cause visible flicker.

And, after I make the hardware, I would need some help on the software
side in order to inform TOS that higher resolution is available. I know
that it involves some tweaking with Line-A variables, but there my
knowledge ends.

>I guess that this upgrade won't fit inside the ST case?

I don't see why it would not fit. I have once made a similar prototype
circuit which worked, but adjusted for 640x400 display at 10MHz system clock.
The circuit contained eight 74*** chips and did not take much space. It

should be located near or upon the Shifter or the Glue chip. The same
circuit adjusted for higher resolution would use the same number of chips.
Chip count could be reduced to seven or so if one dispenses with the
possibility to switch "live" from 8 to 10MHz - part of the circuit that
provides glitchless switching bitween asynchronous 32 and 40MHz clocks needs
about three chips, while only one would be needed for off-line switching.

Note that this is only intended for (extended) ST-high, the other resolution
modes being kept as they are. I estimate that a design that would provide for
all resolution modes and two system clocks would be uneconomical without the
use of an EPROM or two.

Btw. I hoped that, if I create a 640x400 picture at 10 MHz system clock,
I could use Lacescan to increase the resolution- but for my prototype circuit
the computer had to be switched to "external sync" mode (no trace cutting
on the motherboard, new syncs just fed to the same lines as the old ones)
and Lacescan refused (or couldn't?) work like that. If that proves to be only
a sotware limitation in Lacescan, then all problems are already solved and
the circuit can be kept simple.

>I hate to admit that I must wear reading glasses for such work :-(
>If you're into SMD devices you can expect to have to use a microscope!

I am not -that- perverse. I only use a magnifing glass and keep
away from SMDs :)

Most modern TFT screens are multisync and can handle refreshrates
from 60 to 75 Hz and all common resolutions within their capacity.

Gnerally spoken: they all can simply replace a standard ..VGA monitor.

So if your Falcon drives a common PC monitor, you'll be OK.

Note however that TFT screens only work satisfactory in their rated resolution.

For instance, if you buy a 15 inch 1024/768 TFT, make sure (by trying out on
a standard throwaway CRT) that your Falcon can do that.

I might be possible that you must adjust your videomode parameters, but that
would be the case with CRT's as well mostly.

I have 17" TFT's on the TT (NOVA MACH card) and on the MILAN running razorsharp
at 1280/1024.

It is every penny worth the money.

What I like very much either was the lack of scaring noises when switching.

It seems that there are two methods used to decide on whether new messages
are present or not, it's always possible that Newsie is using the "wrong"
method for some reason or other. Whether that's got any bearing on it?

Give Newswatch a try, you'll soon see what's available for download.

Cheers

Source record: 31850

wellllll, better prepare that can of worms. There are major differences
between the ST and an 800XL. From thiss point of view the drive access is
180 degrees different. The 8-bits are Serial and low speed, the drive access
is governed by the drive and not so much the computer, so fooling the 800XL
into thinking the PC is a 1050 disk drive is relativley basic.
Now the ST itself controls the drives and all the data busses are Parallel.
The through put is much higher. It would require a pretty impressive
interface to connect a PC to an ST in that fashion. Also pretty pointless
seeing as you can plug just about any PC drive into an ST.
That being said there are a few ways to pinch PC periphials, GHOST will set
up your PC as a drive Letter, and accessed like any other drive, but it is
SLOW, as it uses RS-232. Also you can network, using Ethernea. And there is
Parcp, as well which uses the Parallel port.

Shutting the can of worms, hope that helps.

Mark

OK, I was exaggerating a little ;-)

It's not a job that I relish though, although I've been able to make a PCB
(with Scooter, to keep it Atari-related) and solder quite sucessfully.

>So yes, a magnifier or microscope is great, but you can achieve a lot

Absolutely - I'll add that if anyone's tempted to branch out into using these
packages, then I recommend sticking ICs to the PCB before soldering to stop
them from wandering about - bad news.

Cheers

It's generic printer drivers that seem to be the problem, I suppose that a
printer spooler could be installed under MagiCMac to capture to a file which
could feasibly be sent to the Mac printer system under the Mac OS?

That might be the answer if there's only a USB printer available so there's
no chance of using Powerprint.

Cheers

>No, i mean 800x500, i.e. 25% more in horizontal and vertical directions;

Right, I was thinking of the 4*3 aspect ratio. I don't know how much if any
software would be "broken" by wrong values, but if Lacescan and Overscan both
work OK then it should be OK.

>I think that one would have to slightly modify the SM124, in order to lower
>its vertical sync frequency, probably by increasing a capacitor value in the

>

Most Atarians wouldn't like fiddling inside their monitors anyway I guess.

>vertical circuit. The problem is that for 600 lines the vertical scan rate
>would have to go below 60Hz, which may cause visible flicker.

The flicker-free standard values are what makes the normal res. so clear of
course, 60Hz is right on the lower limit of acceptibility IMHO (I'm using
that on this CT2 Falcon with Videlity).

>And, after I make the hardware, I would need some help on the software
>side in order to inform TOS that higher resolution is available. I know

I can't recall how Lacescan/Overscan did this.

>The circuit contained eight 74*** chips and did not take much space. It

I suppose a PIC chip could be persuaded to provide some logic switching, but
I've never tried anything like this.

>>If you're into SMD devices you can expect to have to use a microscope!
>

>I am not -that- perverse. I only use a magnifing glass and keep
>away from SMDs :)

I just picked up the latest Maplin (a UK hobbyist chain store) catalogue,
their inventory of components seems to be swinging towards SMD.

Cheers

Derryck

Check out the list, or simple guide to setting it up. I did it and
it's located at http://hardware.atari.org/setup.zip You'll need to
read the insturctions I posted on this newsgroup back in may on how to
set it up, which files to modify. The archives should have that post.

Hello,

There is a program called 800XLDJ that emulates an Atari 8-bit disk drive.
Works with the SIO2ST(PC) cable. The same one that APE uses. Just hook up the
XL to the ST (goes in modem port) and you are all set. You will be able to
load 8-bit programs to th XL from the ST desktop.

Howdy folks,
I am considering connecting my Falcon to the internet, however I am unsure what modems are compatible. The modem on my parents PC Modem kept loosing the connection, a problem that was solved by replacing it with a modern V90 compatible modem.
Based on this it would appear that a modern V90 56K modem would be the way to go but will these opperate with the Falcon or should I be looking at older secondhand modems?.

Thanks,
Stephen Moss

You can use any AT-command driven modem with an serial port.
ELSA, ZyXEL or other like this.
On Falcon use latest HSModem7 serial driver for best results.

Hallo Stephen!

SM>Based on this it would appear that a modern V90 56K modem would be the
SM>way to go but will these opperate with the Falcon

They surely will, as long as they are external, provide a serial connector (no USB) and "understand" normal AT commands. For use with telefax programs such as StarFax, it's got to be fax class 2 compatible.

mit freundlichem Gruï¿½ aus Bubenreuth

> looking at older secondhand modems?.

As mentioned in earlier responses, any AT (Hayes) compatable modem with the proper 9pin cable should fit the bill. Do install HSMODEM, otherwise you are bound to have trouble with high baud rates.

I find that on my Falcon/Modem combo a port setting of 57600 works best. Yours may work better at 115200 (check the modem manual for recommended port speed). If a 56k modem is giving you fits...try different port rates...also ensure you've the correct bit/duplex/handshaking protocols set. The current standard for Internet Dialin tends to be 8 Bits, No Parity, 1 Stop Bit, CTR/CTS and to have the modem set to hang up with a DTR drop.

If you've older/slower modems recommended port settings tend to be:
33.6 Modem :57600 or 115200
14.4 Modem: 19200
9600 Or slower: Try 19200 first and work your way down....

Here are some helpful sites for locating things such as HSMODEM, a good CPX for setting your port(s), TCP/IP stacks, etc...

http://users.pandora.be/tos4ever/atari/prg-ind3.htm
This is a good start for finding many helpful Atari softwares...
A few links may be outdated or not working, but for the most part this site is excellent!

Be sure to get HSMODEM. I highly recommend that if you haven't already done so...also get the latest STing package, which also has avilable modern PPP dialers and a CPX for setting up your port(s). STik 2 is also nice if you've little need for bells and whistles like IP masqurading or Draconis Stack Emulation.

http://www.cix.co.uk/~derryck/html/misc.htm
Here you will find english Documentation for the HSMODEM package.

Happy Surfin'

Good question...
I vaugely remember reading some posts on the MiNT mailing list about cross
compiling for Atari machines on Linux or other UNIX variants.

Here is the FAQ about getting on the Mint mailing list.

http://freemint.de/docs/mint-list.FAQ.txt

You can also check the mailing list archives at:
http://wh58-508.st.uni-magdeburg.de/mailinglists/Mailing-Lists/MiNT-List.index.h
tml

Of course, keep watching here for posts...and ya might also want to check out:
http://www.atari.org

Hope this helps...

For Atari ST/STe/TT/Falcon/etc... ???
Not that I know of....

AFAIK the most up to date CD burning software for Atari is ExtenDOS Gold with CD Writer Suite. It is actively supported.

2614. Trouble getting SyQuest Drive to boot

Newsgroup: comp.sys.atari.st
Date: 2002-10-01 04:42:08 UTC
From: nurmix@spam-free.com
Message-ID: <3d992467.10196012@news-server.socal.rr.com>
Source record: 31870

A friend of mine is setting up his 1meg ST (TOS 1.02) with a SyQuest EZ135 drive that I sent to him. He is using the ICD Link II along with the ICD driver.

He can format and partition a cartridge, but once he's done that, the ST still won't recognize, or boot from the drive.

The EZ135 is the only drive connected to his ST. It is set to SCSI ID 0 (zero). When partitioning under the ICD utilities, he correctly sets up the first partition as a GEM partition, so that it will be bootable.

After partitioning, if he reboots, and tries to install drive C on the desktop, he can add the drive icon to his desktop, but clicking on it tells him the drive doesn't exist. And attempting to run the ICD Utilities to configure and set up the drive as the boot drive doesn't work either - it tells him there are no bootable drives.

The drive itself works fine, as I had it connected to my Falcon for a while before sending it to him, and I was able to use it without any trouble. And he previously had a JAZ drive connected to his ST, which worked well until recently. He thinks it stopped working because his cartridge went bad, but now, seeing the trouble he's having getting the SyQuest to work, we're starting to wonder if there might be something wrong with his Link II, or perhaps the SCSI cable itself? Although if that were true, I don't think the drive would even format with the ICD utilities.

Anyway, can anyone think of anything else to try to get this to work? It's been a while since I messed around with hard drives and ICD software on an ST (since I really only use my Falcon with HD Driver these days). He doesn't own any other hard drives, and ICD is the only driver software he has at this time.

Thanks in advance for any help!

I don't know however any software that states it is for the ST, STE or Mega STE software should run on the STE although it may not have been written to make use of some of the STE's additional features.
If it does not state this (ie STE/Mega ST only) then it is unlikely that it will run on an ST as it uses the enhanced colour palette and so the display is uninteligable or more likely because it uses the Biltter and the program will crash as it cannot process the graphics commands. Although some games like Dragons Lair were coded to run on the ST but to also take advantage of the STE's enchnced colour palette if it is available.

> What's up with the compatibility between ST and STE machines? Do you
> have some links in comparison between both computers? I'm new to the
> STE line and want to use the enhanced options...

The main differences are as follows...
1) Stereo Sound output
2) Two additional "enhanced" Joystick ports on the left hand side - these accacpt both digital and analog input are for use with Light Guns (for shooting games), Paddle Controllers, analog Joysticks and the Jaguars "Jagpad" controller although I'm not sure how many games made use of them.
3) Memory is provided on 30 pin SIMM Boards as opposed to PCB mounted which makes upgrading the memory easier if you can find the SIMMs
4) Enhanced Colour Palette using four bits for each of the three primary colours providing a total of 4096 Colours as opposed to the ST's 3 bit, 512 colours.
5) Blitter Chip installed for improved graphic (sprite) handling
6) There were also some improvements to TOS, if memory serves you can use desktop icons (shortcuts) to run programs from the desktop without having to go through the file menu.

I'm sure someone will correct me if this is incorrect.

Yes, there is, but it's a shareware : CDLab.
You can burning but only DAO and with the shareware realease, you'll
only be able to perform single speed (1x) recordings.

http://fgalea.free.fr/cdlab/info.html

But I think that it's no supported now.

>have some links in comparison between both computers? I'm new to the
>STE line and want to use the enhanced options...

Hi all

Generally STE enhanced games will tend to be STE or Falcon only.

Some STE friendly games, although the coding is ok, can fail on the disk protection, the good old Rob Northern suddenly springs to mind.

Some early STOS games also fail!

BUT... it isnt all doom and gloom, there are ways around many of the problems. Using a disk based TOS version, like v1.09, will allow you to run rebel STOS programs on the e's.

Another problem, but rarer, is that some software doesnt take into account the change of address for the screen memory and presume it remains at the same location. There is software so that you can fool the computer into thinking it's only got half meg memory.

A few of the 'e'nhanced features on the e's are:

improves sound and stereo output
improved colour palette
blitter chip
2 enhanced joystick ports, you can use the Jaguar gamepad in some games such as 'substation'
easily upgraded

I think more serious software has been written to take advantage of the extra bits than games.

Hyperpaint 2, which is the same as Hyperpaint but allows the use of the hardware scrolling and enhanced palette.

Music Maker 2, again same as music maker but with the enhancements for the sound.

TCB tracker allows you to change treble and bass.

Are just a few of them:)

I suppose that he's terminated the drive? The EZ135 needs a plug-in
terminator block in the setup you've described.

Cheers

2624. [UPD] October Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2002-10-01 12:54:57 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <anc5v1edm1@news.x-echo.com>
Source record: 31883

Hi,

My software "Eureka" has been updated and released on my WEB site.
I wish that you appreciate it, like always. It's a "2D Graph Describer"

and a "3D Modeller". I must tell you, and it is important, that I have
a new host for its site. So remember :

http://eureka.lutece.net/eurka210.zip
That is the Complete Common Edition

http://eureka.lutece.net/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.lutece.net/eurka020.zip
Is the Complete 68020 Edition

http://eureka.lutece.net/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.lutece.net/lib_dgem.zip
Is Dynamic Libraries Extensions for Eureka

http://eureka.lutece.net/tiny043.zip
Is the Open/Gl Extension (requires previous package)

I wish you big fun with all this STuff.

On the other hand, I told to the www.atari.org webmaster that my
web subdomain and E-mail forwarding should be updated. But I don't
know precisely who to contact. So my atari.org usual redirection
are false. If you know which person to contact, tell me more ...

Regards,

-- Fran&#65533;ois LE COAT

Thanks for your response, Brian.

I guess it would be easier to compile the software thru an emulator that's running a native compiler, like LaserC, for example. Speaking of LaserC, I purchased a book for it a few weeks ago, but I have been having considerable difficulty finding a copy somewhere. Anyone know where I can find a copy (to purchase or to download)?

Michael

This is a good list. However, the STE line also had these additional
features:

* Hardware-assisted horizontal and vertical scrolling on a pixel basis.
Previous generations of the ST line could only do vertical scrolling
through hardware. Horizontal scrolling had to be done in software,
which required optimized, low-level code to get decent speed.

I think there was a handful of STE-enhanced or STE only games that took
advantage of this. However, most often, these effects were exploited by
demo programmers.

* 2 D/A converters that allowed for hardware digital playback up to
50Khz in stereo. This new sound hardware was in addition to the ST
line's 3-voice sound. It could also generate a variety of different
tones and effects, was DMA controlled (for less CPU involvement) and
offered separate control of both treble and bass. What's more, this
hardware could be used simultanously with the ST's regular sound chip.

Not really necessary. Adjust the chip, solder corner pins to fixate the
chip, then solder the other pins. Extra flux helps a lot.

2631. For Sale - Steinberg Cubeat, Roland Tentrax, C- Lab creator manual and C-Lab export

Newsgroup: comp.sys.atari.st
Date: 2002-10-01 19:40:27 UTC
From: Rob <rob.jenkins2@btopenworld.com>
Message-ID: <j5ujpu85r34t7k9s6l8rcefuut983gks6t@4ax.com>
Source record: 31890

No prices as yet decided but feel free to e-mail me an offer.

Tentrax - in excellent condition.
Cubeat
C-Lab creator manual, this is in fact the normal creator package minus
the dongle (i bought it that way) tho may be a useful manual to
someone. (does include original creator disks)
C-Lab export - 3 midi out, serial port device in its origonal tin.

Also, a 4mb 520STE and an external disk drive.

All in working condition.

If there is lots of interest, I may just pop them up on ebay (uk)

Thanks.. Rob

OK. Is the drive terminated? Does any partition exceed 127MB? Did
he format the cartridge or just partition it?

>
> After partitioning, if he reboots, and tries to install drive C on the

That's because there aren't any drives in existance. Something has
happened.
>
> The drive itself works fine, ...
Well, worked fine, at least. Shipping can damage delicate drives.

> He thinks it stopped working because his cartridge went bad, but ... might be
> something wrong with his Link II, or perhaps the SCSI cable itself?

The Link II is unlikely to go bad, as it's pretty sturdy. The cables,
on the other hand can go bad when moved.

> Anyway, can anyone think of anything else to try to get this to work?
I'd start by switching cables and making sure I had a physical
terminator attached. Next, I'd attempt a low-level format followed by
a "Check for bad sectors". If all went well, I'd attempt again to
partition as 8MB and 127MB partitions followed by creating the boot
drive on the 8MB. I rather suspect either a cabling or termination
problem.

Galen

That's what I stick them down with, extra flux. Then it is easier to fix
the corner pins. I use a tiny screwdriver to lay flux on the solder pads,
in one fell swipe, and that holds the chip in place while I solder at it.

Hm - the flux I use does not stick very well, it is quite thin (consisting
mostly of alcohol).

Got further info from Jeffry Krzysztow, he doesn't know when he'll get
his STe back up and running.

He has asked me to post a message requesting anyone who has a copy of
Gemvelope 2.96 to email it to him, and he will post it on his website.

His email address is jkrzyszt@yahoo.com.

Well, to me you have alcohol flux. After vistiting my refrigerator, I see
that mine was made ten years ago, and I still have most of the quart
bottle left. That is about one liter. It is Kester Formula 1544 fully
activated rosin soldering flux. There must be something like that
available in Germany. Mine says it is for industrial use only. I think I
got it through Newark Electronics.

Jim

I just learned something old and almost useless, but I have not
seen it documented anywhere.

It involves starting a program from the newdesk.inf or desktop.inf
files.

The syntax is #Z 01 drive:/folder/file.prg

Placement noted was just after the header lines, and before the
file-type and drive names lines.

If you use an Atari for just one purpose, this could save time.

Yup. I used something like that before, however thinned enough with alcohol
to not be too sticky.

>available in Germany. Mine says it is for industrial use only. I think I
>got it through Newark Electronics.

Yes, it is available, but I am happy I now got hold of some no-clean flux
(clear liquid), which is not that easy to obtain in small quantities (it
came in a nearly empty 20l canister ...).

That one does not stick at all, but is great to work with.

I can't seem to find flux cheaply. Do you tin the tracks first and
just heat the pin to solder it, or do you use fine tip soldering iron
and thin solder? I just see a gallon of that flux you mention costs
about $50, I guess it lasts a long time.

Oh yes, absolutely. I sent him one with the drive, and he told me
it's attached.

>OK. Is the drive terminated? Does any partition exceed 127MB? Did
>he format the cartridge or just partition it?

Yes it is terminated (I sent him the terminator plug attached to the drive, and he didn't remove it).

I sent him 4 cartridges, all of which I personally formatted AND partitioned on that drive while it was connected to my Falcon (before I sent it to him). They all worked fine, with no bad sectors. Since he's had it, I believe he has only repartitioned (not formatted) some of the cartridges.

He tried various different partitioning setups, but always leaving at least the first one less than 16.77MB (which, according to the ICD manual, is the limit for TOS 1.02 GEM partitions). And no, never did any partition exceed 127MB.

>That's because there aren't any drives in existance. Something has
>happened.

Yes. It "sees it" to do the partitioning, and he can even run the RATEHD (hard drive speed test) on it, but TOS doesn't see it - in so far as allowing it to be accessed or booted.

>> The drive itself works fine, ...
>Well, worked fine, at least. Shipping can damage delicate drives.

Always a possibility, but if the drive were that damaged, I don't think he'd have ben able to partition any of the cartrdiges at all.

>The Link II is unlikely to go bad, as it's pretty sturdy. The cables,
>on the other hand can go bad when moved.

Yeah, I'm suspecting the cabling as well. Unfortunately, I didn't send him any cables - he's making use of the one's he already had, so I don't know their condition, and I don't think he has a replacement either.

>I'd start by switching cables and making sure I had a physical

>problem.

I'll suggest these things to him. Perhaps the smaller 8MB first
partition will do the trick.

Thanks for the helpful suggestions.

Hi,
I recently got an 1040 STe from a friend but it will not boot.

The Power Supply works. I noticed the simms were loose but reseated
those.

What to check next. Should I try pushing down on the socketed chips. ?

There is only a few most are soldered.

I've never had an STe before just a 520 ST.

Do I need a diagnostic cartridge. ?

What chip does video. ?

Thanks for the time.

You have to be careful what you press - I remember seeing it written in one of the ST mags that you should lift the ST from the bench a few inches and then slam it down. This would reseat the chips.

I would be a bit careful how you do this and must say - don't blame me if it does some damage ! I have found the method effective with one of my STs though.

```
Using A F030 with a TFT can be much better than with a CRT.
This is because in a TFT screen the refresh rate is not
dependent of the vertical frequency of the input signal.
I use use a 15" TFT at 1024*768 (non-interlaced) with a refresh
rate (vertical frequency) < 50 Hz (with Videl clock = 50MHz)
It displays an image of very good quality, whereas doing the
same on a CRT would be painful due to the low refresh rate.

I have installed a Fujitsu 2.16 GB hard drive model #MHF2021AT and cannot get it to auto boot. It will work if I run HD Driver.prg. The old conner 84 meg drive was able to auto boot. I have installed HD driver 7.4 and then tried version 8.1 with no success. I even tried installing CBHD and that didn't work. Did anyone in this group ever have a similar problem.

Thanks for any and all help.

Ah yes, the 4 inch drop test. Used it on the old 520 when things would
just not work right. Anyone doing this should only do it once in a great
while... Any more than that could dislodge components on the board and
cause other problems.

With the internal p/s in the STe I really would not recommend that approach.
Do the old fashioned process of elimination. Carefully press down on what
is socketed and look/smell/feel for any components that might have fried.
Pretty easy to spot those things that are obvious, and not, on the not so
obvious. If you run into a block wall, call over to Best Electronics.
They know an awful lot about Atari machines and common ailments.

2657. New on TAMW: Fractal Music Composer Docs and more

Newsgroup: comp.sys.atari.st
Date: 2002-10-03 06:33:19 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0210022233.52c46432@posting.google.com>
Source record: 31817

Hi All

Some new items on the FMC (Fractal Music Composer) Page on TAMW:

FMC MANUAL now Released!

Hugh McDowell has now agreed to release the manual . Using the initial hardcopy manual I was able to create a Word Document with the screen shots and numbering system as presented in the original manual. It was converted to PDF format by Trond Einar Garmo of the Norwegian University of Science and Technology. Trond is also a member of the Atari-MIDI forum.

SPECIAL STEEM VERSION
For running FMC in Steem, the Atari Emulator for PC

The Steem programmers found a fix for the bug that prevents FMC from writing MIDI files to the hard drive while running under Steem. To impliment this fix, I have created a special version of FMC as an .ST file for installation in Steems virtual A drive folder. Simply copy the Fmc.stt file to the folder you are using for A drive. Run Steem. Hit the pause/break key to access the Steem menu. Then under DISC MANAGER, you can drag over the FMC.ST file and mount it in the A drive. Close. Start emulation by selecting the green arrow. Once you are on the Atari desktop, open A drive and run fixdfree.prg. This will fix the bug. Then when you run FMC.prg, you can save your MIDI files to C drive, and not just the A drive.

These are now available on my FMC page at TAMW:

http://tamw.atari-users.net/fmc.htm

We are also exploring FMC this month at the Atari-MIDI forum, so feel free to join us.Info on the Atari-MIDI forum on my main front page

2658. Favourite Atari ST compiler?

Newsgroup: comp.sys.atari.st
Date: 2002-10-03 07:03:12 UTC
From: michaelgale@sympatico.ca
Message-ID: <3d9be933.19870046@news1.on.sympatico.ca>
Source record: 31813

Hi,

Well, I've been doing a lot of reading and searching and I can't seem to find a copy of "LaserC" anywhere. Most information that I've read about that legacy compiler seems to be negative. I'm not terribly disappointed, but I would still like to find a copy. Since I have virtually no experience compiling applications for the Atari ST/STf platform, I've decided to ask what is your favourite native C compiler or assembler for the Atari ST/STf? If it's possible, could you provide a link as to where I could find/puchase a copy.

Any and all opinions are welcome.

Michael

Very long. 100ml will last forever unless you spill it ;-)

Well, it was an obvious question ;-)

I'm stumped in that case, but TOS1.04 isn't known for its quality of hard
drive support.

Cheers

2662. Re: Declaring Alt-RAM

Newsgroup: comp.sys.atari.st
Date: 2002-10-03 15:13:45 UTC
From: Jim DeClercq <jimd@panix1.panix.com>
Message-ID: <anhmr9$ff2$1@reader1.panix.com>
Source record: 31820

What I personally do depends a little on the technology involved.

First, the board solder pads get cleaned, in any manner than works.

The, my flux is applied to the solder pads, and necessarily to the
surface between the pads. Extreme neatness is useless.

Then, the chip leads stick to the flux, and make it easy to adjust
to match up to the pads.

I use either a very small soldering iron, or a pencil point iron, to
solder corner pins.

If the chip is a gull wing one, I use a chisel point iron, 1/8 inch or 3
mm wide, and tin that, leaving a little extra solder on it, on what may be
called the top side. Then, wipe the bottom side along the row of pins, and
they will all be properly soldered, with no bridges. The thick flux
does that.

If not gull wing, it is one pin at a time, possibly with a little extra
tinning on the iron, because the flux is already in position. That little
extra bit of solder is all that is needed.

So I think you need thicker flux for some jobs, but I do not think you
need a gallon. I cannot think of anyone, even a school for electronics
technicians, who needs a gallon. Mine came in a quart bottle, and that
bottle will outlive me and all of my tekkie friends.

Jim

Where is that store?

Those connectors and cables were quite common, once, for all "raster"
printers, now known as laser printers. But they were not common around
where I live, and I would like to have a few.

How might I go about getting a few of those cables?

Source record: 31822

No, not exactly, since I own neither a Falcon or a 840c.

But there is a generic answer that works for most printers.

Old printers had both a text mode, using built-in fonts, and
a raster mode, used by printing programs that printed rasters,
such as Calamus. New ones just have a raster mode. If you
only need raster mode, and if you have a driver for a HP xxxC,
it should work for that.

In other words, the answer depends on what you use it for.

From: Rob <rob.jenkins2@btopenworld.com>
Message-ID: <cvpopu0sl1r5bmcgnseq6kkkr7bvfp53mr@4ax.com>
Source record: 31824

Hi, at the moment, I have a soundpool SPDif unit that isn't being
used.
The reason, when I bought it, there was no cable to connect it to my
falcon, and there where no drivers for it.
I now do have the drivers, but still no cable, and while I've been
pondering over it, I've realised I'll probably never really use it as
I'm primarialy midi.

The unit does have a small parallel cable sticking out the back of it
to connect it to an FA4 or FA8, so this may be of use to someone.

I've borrowed a camera off a friend, so if you want a picture of it,
just say, I've got one ready.
If anyone is interested in this, and is willing to make me an offer,
please do.

Thanks.. Rob

If you're stuck with windows install Cygwin, then add Frank's
m68k-atari-mint cross. There's many adavntages to this, two of which
are (a) it opens you up to all that unix opensource, (b) at least one
of the ST emulators is (or can be) built within cygwin.

> Anyone know how this works?

Check this site...
http://www.oelwein.de/philipp/personalien/connect.html

There is a single English paragraph on the page...
Also there are English versions to download...
It's been quite some time since I've done the install, but I'm 99% sure I found the English docs to MKPASS.TOS in the English package from that site.

Working from memory as best I can...
You first launch CoNnect...
Pull up the Register Screen...
There should be a program number, and then under that, empty blanks where your key will go. Write down the program number given (or use cut and paste if your TOS terminal supports it). Run MKPASS.TOS...enter that number (or paste if your term supports it)...it will then give you a key. Do be aware that you might possibly need a little utility that holds the SCREEN for a keypress after a TOS application terminates (so you'll have time to read the key!)...or...run it inside something like the MagiC VT52 window, Geneva's TOS window, TOSWIN (under mint)...or whatever method you use to hold things long enough to be read.

Well, I have ICD Pro on my Falcon (although I mainly use HD Driver),
but he is using whatever version of ICD software came with his Link
II.

>Cabling can do strange things.

Yes, that's true. I'm still not sure if he has another cable (he's in
Tennessee and I'm in California, and I haven't talked to him in a few
days) - but I think that's probably the problem, given that his JAZ
drive was having trouble prior to connecting the EZ135.

>No, it shouldn't have any effect.

Well, I thought perhaps with TOS 1.02, maybe a smaller boot partition
would help. It might be worth a try.

Thanks!

HI,
I have LASER, MWC, and Lattice 5.6. (I even have the oldest ATARI compiler
from AVEMDA I think)
Anyway the favored compiler now days is GCC egcs or later. I. however, have
never managed to get
GCC working. The newest one is too big in the tar ball and I have not tried
to unravel it.

I played with Sozobon, even managed to turn out a few programs
with it. Seems to work fine. I know it's been long neglected,
but is there any particular reason to avoid it? It's not as
up-to-date as gcc, and it's not as slick as a commercial
compiler, but it's free and it fits on any system from two
floppies to a hard drive.

Source record: 31748

> Been there. That's where I downloaded all the files from.
> English resources and all.

Okay...
Here it is snipped from the CONNECTE.TXT file.
Check that you have all of these archives....
1. CONN95DE.LZH
2. CON95UPD.ZIP (This is where this info is clipped from).
3. C95RSC_E.ZIP

Unpack them in that order so that 2 overwrites files in 1, and 3 overwrites files in 2, etc.

If you are missing any of the above packages...let me know how your spam-block can be removed and what archive(s) you are missing...I'll be happy to send them to you. Also, see the note about CoNnecT 97b at the end of this message...

This key generator also works for the old CoNnecT 2.46...
Personally, I went back to 2.46 because the COSHY shell in that one does a better job of working under MiNT as a tty type window (thoe not the easiest to set-up solution...it can be made to work if you ever need a TRUE VT102/ansi emulation via unix pipe.

CoNnect 95 and lower:

From version 95 Connect uses a new key system in which it is no longer necessary to specify the operating system (but that is not the only alteration). You obtain the new key in following way:

a) Start connect.prg, open the Registration dialogue, type in your name (and address, though this can be omitted) and press RETURN. CoNnect will assign you a User-ID at top right of the 'Key' section. Write this down carefully.

b) Start mkpass.tos that is included in the package, either by using 'Run a program' or after quitting back to the desktop. It expects two input lines terminated with RETURN, with the names you used in the Registration dialogue and the ID that CoNnect has assigned you. Case matters so make sure you type in everything exactly as in the Registration dialogue! mkpass.tos will then output the required key, which you must note down again.
However, unless you have arranged for TOS programs to output to a window rather than directly to the screen, you will probably have to install hold_it.prg or something similar in your AUTO folder and hold down ALT while pressing RETURN after inputting the second line, because otherwise you won't have time to read your key!

c) In case that you have WWW-access, you can use the URL

http://www.cable.de/~philipp/personalien/connect.html

to call up a form for interactive online key-generation (in the lower area). Enter the data in the corresponding fields and you will get the key returned as output.

d) Open CoNect's Registration dialogue again, and if you have quit CoNnect to run mkpass.tos type in your name and address as before, and then the number that mkpass.tos returned into the field below the User-ID. Click OK and if you have done everything correctly, CoNnect will inform you that the registration has been successful and that you should now Save options. If you have made an error, it will tell you that registration was not successful and you will have to try again.

Use a new directory for the installation of CoNnect, i.e. do not overwrite an existing installation. In particular you must not mix up the setup, options and NUM files in the different versions.

CoNnect 97:

Here the key checking is already deactivated. Just enter anything you like into the key field of the registration dialogue. After this CoNnect 97 becomes a fully unrestricted version.

Note once again: CoNnect 97 is really a Beta version and at the same time the last. Errors may appear and these will *not* be corrected any more. Further development has been suspended.

Just sounds like loose chips to me. I have a 1040ST that I sometimes need to press down on some chips to get it to boot. You may need to have some chips re-soldered down. What exactly happens?

Now that you mention it...
I'm not positive...
Check the dates of the files inside the archive...
If the RSC is older than the english UPD package, then I guess not ;)

> The good thing is that I managed to work it out. The bad news is that it
> was pretty cumbersome. This is what I did:

Good that you got it to work ;)

I've never used MagiC Mac...
Here on my Falcon however...using MagiC, there is a VT52 Command Line utility
inside the MAGIX folder. It can be set up as the console window (in place of
the one that comes with Thing). One of the nice things about this tos in a
window utility is that it DOES support cut and paste (cntrl C=copy, ctrl X=cut,
ctrl V=paste). It can also be set to pause on exit, and more. I don't use it
as much as I once did...but for some reason I'm remembering that MagiC also does
a pretty good job of allowing copy operations from standard GEM dialogue boxes
and such (use ctrl C).

If my info isn't correct...forgive me...
It's worth taking a closer look if you do alot of cutting and pasting thoe...

Hi Hallvard,

HT>I unpacked "CONN95DE.LZH"
DE means DEutsch (german), 95 means 1995, of course. Therefore I
recommend you to make run CONNECT97, the final version. I've been
running it for years without major problems.

If you encounter difficulties to produce your key, send me 'your name'
and I'll produce your key. The easiest way to do so is to do with a
command line interpreter.

HT>Why couldn't the programmer just add a couple of text lines explaining
HT>this in the program???
For Connect was shareware first and at that time MAKEPASS was used
only by himself.

Und TTschï¿½

Hi, I'm Ben Smith of Bravo Sierra Computers! Your Benefactor, an Atari Dealer. Offering Sales, Support & Service of Atari HardWare, SoftWare, Books & Accessories for the Classic Atari 8 Bit and Atari ST Computers plus the 64 Bit Atari Jaguar Game System. I am a Reseller of Used & New Atari Collections! Much of which were the Treasures of Former Atarians, Locked away in Dungeons, now given New Lives, offered to be sold as New found Treasure, back in Circulation in the Atari MarketPlace. Hidden and Forgotten, Now set free from the secret hiding places. Atari Heaven where former Atarians had left them to Die. Saving Wondrous Collections from being irretrievably Lost! As well as Saving entire inventories from defunct Atari Dealers, much of it +NEW in the BOX/BAG! After Languishing in Forgotten Warehouses, long abandoned by retired Atari Dealers!

I love saving my customers money! I mainly use Postal Delivery! I save money for my customers when using Postal 2-3 Day Priority Mail & Global Priority Mail. I use Packaging supplied by the Post Office for free and Pass on the savings. I sell Atari, I'm not in the Business of Profiting from Marking up on the cost of Shipping! And just like the Postal Service I avoid making promises I cant keep. The Post Office sends Packages by 2-3 Day Priority Mail. They don't promise 2-3 Days but they have a Good record of Following through! Once I receive payment, your order usually goes out the same Day! This is not a Promise, but like the Post Office I have a Good record of following through! Ask my Customers! I also have Libraries of Reference Books for the Classic Atari 8 Bit and the Atari ST Computers! I have ways of saving Money on Postage by Sending it Book Rate. I also have some tricks for saving on Postage when Mailing outside the United States! I Ship Atari anywhere the Law allows! If you dont come to me, I cant save you any Money!So check my HotLinks below, E-Mail me at atari@aracnet.com or call Ben anytime at (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

2702. TechTV "The Screen Savers" seeks Atari computer users for the show!!!

Newsgroup: comp.sys.atari.st
Date: 2002-10-06 05:18:36 UTC
From: nurmix@spam-free.com
Message-ID: <3d9fc2f2.3476940@news-server.socal.rr.com>
Source record: 31761

Hey,

I don't know if TechTV is available anywhere else but North America, but even if it's not, Atari users here should be interested in this post.

For those of you who aren't familiar with TechTV, it's a cable television network all about technology, computers, etc. There are many invidual shows on the channel, the most popular being a show called "The Screen Savers". It's basically a computer show, where they feature information on new stuff, tech help, tips, web site features, etc.

In their most recent show, they mentioned at the end that they noticed that about 5% of the people who visit the TechTV/Screen Savers web site are using Atari computers, and they want to know how!
:-)

And here's what they posted recently on their site:

"Got Atari?
We've received statistics that a few brave souls out there visit this very site using Atari computers (STs, we're guessing.) If you're one of those souls, email Joshua Brentano. We'd like to feature you on the site and/or show."

(by the way, this guy's e-mail address is: joshua@techtv.com)

So, I'm planning to e-mail them myself, since I still use my Falcon daily (although not much for web surfing these days). But I think we really need some more of you who are actively using your STs or Falcons on the Internet (and Hades users too I suppose). This show would be a great way to get the word out about Atari users, and how we're still going strong. I'm sure they would be quite surprised to see what we're still capable of doing with Atari computers.

So, send an e-mail to the address above, or visit the TechTV / Screen Savers web site if you want to find out more about them. And by the way, here is the specific link where they posted the request for Atari users to contact them (about half way down the page):

http://www.techtv.com/screensavers/shownotes/story/0,24330,3401453,00.html

And for what it's worth, I have no connection to TechTV, or "The Screen Savers". It's just that I think it would be really cool to see some Atari hardware and software featured on their show. Heck, in the past, they have done segments on Atari video games, and emulation, and

the main host (Leo Laporte) has mentioned many times that he has fond memories of Atari computers, as his first computer was an Atari 8-bit.

So, let's all send them an e-mail. Who knows, maybe we'll even be asked to be on the show?

Hm, I guess they would be even more supriced to know that it's not only
possible to browse but also _serve_ the web with any ST with 4 MB RAM
(maybe 2, haven't checked).

Guess I should mail them so they can try out how it feels to browse on an
Atari web sever :-)

Which version of TOS? If its 2 or higher, just select install drives from the drop down menu. If its TOS 1, click on an existing icon and select install icon. Then change the drive letter to suit. Easy eh.

Message-ID: <3da08db9$0$30462$91cee783@newsreader02.highway.telekom.at>
Source record: 31771

I invented 1991 the GEMINI inhabited solar power plant.

http://www.pege.org/gemini

I wrote 1993 a book about the house on my ATARI TT
and Calamus.

The house was 2001 the main attraction on the Styria
country show for energy.

http://www.pege.org/gemini-house

Now I want to put the whole book in the internet
for free download.

My only problem:

About 50% of the *.CDK files of the book are
with compressed bitmaps only possible on
the ATARI version.

So the Calamus on my windows notebook does
not load 50% of the files.

Is there somebody with an ATARI ST/TT and
Calamus willing to help an environment
organisation?

Actually, I got that backwards -- ICD Pro is needed if you DON'T have
the Link.

If I recall, I once got my ICD software corrupted and it caused all
sorts of headaches. Switching to ICD Pro (including my Link-ed ST)
solved the problem.

You need to delete desktop.inf from your BOOT drive. With TOS 1.02 unless
you hand edit the inf you can't set up any icons. Boot of a floppy with a
hard disk driver and delete it that way.

Message-ID: <7d24ed2c.0210062054.5ea7e49e@posting.google.com>
Source record: 31779

Hi ,

I have an old MEGA STE and its 48MB SCSI drive has read/write errors (11 years old) and now I need an UNDELETE utility that works with hard disks to recover some of the data.

Or a disk monitor that supports hard disks , so that I can recover the data myself.

The hard disk has some serious read/write errors , I think because of old age , but the data is only plain ASCII files , so it should be possible to recover it.

If anyone has a link to download a program or can send it to my email address , that would be great.

The computer has TOS 2.05 , and still works except of the HD.I want to change it , but I first have to recover the ASCII Files.

2722. [ANN] Cr&#65533;sus b&#65533;ta 3

Newsgroup: comp.sys.atari.st
Date: 2002-10-07 07:47:30 UTC
From: Pierre TONTHAT <ptonthat@NO.club-internet.fr.SPAM>
Message-ID: <anre2o$d1r$1@news-reader10.wanadoo.fr>
Source record: 31782

Bonjour :)

Available on http://rajah.atari.org or directly on
http://membres.lycos.fr/nef/files/cresusb3_uk.zip (80 Kb).

Cr&#65533;sus is a banks accounts manager/companion. Its goal is to survey your in/outcomes.

If you already use the french version b&#65533;ta2, replace only the PRG and RSC files.

New features in the b&#65533;ta 3:
+ English translation
+ register formular, with hashed key
+ hashed password for accounts
+ new display and misc options
+ multiple selection of operations (Mouse+Shift)
+ editing window opens with double-click on a record
+ record selection faster redraw
+ cut/copy/paste in most of editable fields
- bugfixes (thanks to Jean-Marc STOCKLAUSEN and Dominique AUSSANT)

Though Cr&#65533;sus is usable, registering is not permited now coz it's a b&#65533;ta version.

Regards

Rajah Lone

A bad sector is like cancer for a hard drive. If you get one they will spread. I recomend binning it. Get a scsi controller and drive. You can map out the bad sectors (don't leave them), and you may get a little use out of it until one day ....

>
>I've had a look in the Printer" under the "Options" menu (Papyrus), but
>found no mention of NVDI! All I can see are the printer drivers that
>came with the program.

That option (in the "Options" menu) is for you to either write your own drivers
or to load those supplied by R.O.M - this is also the place to load the STFax
drivers if you're using that program. Nothing to do with NVDI.

I was actually meaning the "Options..." button in the Files/Print... menu which
calls the NVDI CPX if you have selected an NVDI printer in the drop-down above
it. Under MagiCMac, and with the Quickdraw driver selected, that button should
call the control panel that you will be accustomed to when using the Mac's
printer under the Finder.

>However, when going to "Print" under the "File" menu, I can choose
>between all those printer-drivers in addition to the following 3 NVDI
>drivers:

You can delete all those unusable drivers from the Options menu mentioned in my
first para, they're of no use under MM.

>I chose "Mac-druckertreiber" when I tried to print last time.

Yes. BTW, which version of NVDI are you using? If it's 5.02 or 5.03 you can
download the English updater from the NVDI web site (click on the English
language button to get the right language and download version).

>By the way, how do I print from other applications within MagiCMac? For
>example plain ASCII text files via the printer icon on the desktop or
>via "Idealist", or how about printing from ST-guide?

I suppose you could use LPR, which comes with jinnee for plain text files,
Idealist already has an option for output via GDOS, don't know about ST-Guide
printing, but it's probably not directly possible.

>Not sure which CPX module you're talking about though. Perhaps I haven't
>installed the relevant one.

The NVDI Printer cpx, perhaps this was introduced with later versions of NVDI
only?

Cheers

Derryck

Maybe you can try the latest version of MacSound (1.20) :
http://jf.omnis.ch/atarisoft.php
or MagiCMac Sound Driver - MAGXSND (tested under MacOS 9.X) :
http://aniplay.atari.org
who can record samples.

Regards,

Didier.

What version of Calamus was that? I suspect 1.09, and do not
think I have that one. I do not recall compressed bitmaps
in the versions of Calamus I have, which I think start in 1993.

The solution to your problem may be something like TOSBOX, and
a copy of an obsolete version of Calamus. But which version do
you need, or at least which version did you use?

ahhh now why didnt I think of that ?!?! :P I wanna try a AJAX, I seem to be VERY unlucky with the WD1772, so many people seem to think it will work at 16mhz, I think ive found 1 out of about 10 which actually do. The others almost work, some very much dont work! all work fine on 8mhz! I have like 5 ST's in bits now trying out 1772's, Im gonna have to side with the crowd which say its not a good idea!

Hi "Mark Bedingfield"

What scare-mongering crap!. If bad sectors are a problem for the first time with a particular drive then a re-format with mark-bad followed by a re-partition will usually hide them from view. Think before you 'try' to help!.

| A bad sector is like cancer for a hard drive. If you get one they will
| spread. I recomend binning it. Get a scsi controller and drive. You can map
| out the bad sectors (don't leave them), and you may get a little use out of
| it until one day ....

>freezes.

Do not use any variant of serial fixers like HSMODEM as Gemulator is an
emulator...

In the Gemulator properties page you will find "Fast baudrates". Check
this box and Gemulator will use the slow 50, 75, 300 bps etc settings to
simulate higher ones like 57600 and 115200 bps. I do not remember which
"slow speeds" that gives which "high speeds" but perhaps its the same as
within HSMODEM that has the same function.

I have used an older version of STinG with Gemulator with great success
in this way. I think STik can be used as well, but I have not tried...

> Atari web sever :-)

Just be aware that Tech TV demos don't always go according to plan. For instance, if you give them a URL to an ST Web server and they try it on the show, the ST could come off looking really bad if there were some unrelated network congestion at the moment. (The show is nominally "live," although it's repeated in taped form several times a day, so there's no chance to try again later in the event of a problem like that.) Of course, if the ST Web server is hooked up to their LAN, the chances of such a problem will be greatly minimized.

From: northstar2010@_del_ete_yahoo.no (Hallvard Tangeraas)
Date: Sun, 06 Oct 2002 11:21:29 GMT

Hi Hallvard,

>I've had a look in the Printer" under the "Options" menu (Papyrus), but
>found no mention of NVDI! All I can see are the printer drivers that
>came with the program.

Papyrus isn't the most logically written app around... that printer menu
under Options is ment for people who don't have NVDI installed and need
to adjust or create a new generic printerdriver in order to get it working
with their printer.

>However, when going to "Print" under the "File" menu, I can choose
>between all those printer-drivers in addition to the following 3 NVDI
>drivers:
>
> NVDI driver: Mac-druckertreiber
> NVDI driver: Metafile-ausgabe
> NVDI driver: IMG-ausgabe 300dpi

Ah... that's a lot better :-)
But I suppose that you're not using NVDI 5.xx ? Assuming Apple QuickDraw is
installed on your computer then you should also see a line:
NVDI driver : QuickDraw output.

If however you're using NVDI 5.xx and QuickDraw is installed then select
this option in the NVDI printerdriver (instprnt.app) and in the MagiCMac
configuration program (menu Parameters, printer) instead of the "Mac
druckertreiber"

>By the way, how do I print from other applications within MagiCMac? For
>example plain ASCII text files via the printer icon on the desktop or
>via "Idealist", or how about printing from ST-guide?

Like already explained in my previous post, all output using GDOS/GEMSYS
routines is catched and handed over to the Mac printerdriver, assuming
ofcourse that you set it up properly....
I use the Jinnee desktop, to print ASCII files all I need to do is drag
these onto the printer icon (LPR.PRG), or select "Print from the Object
menu). When using that option, Jinnee calls up the text editor defined in
"Applications from the Special menu", I use QED or Luna as standard editor,
these two apps allow printing under GEMSYS and GDOS, what it comes down to
is that you can print an ASCII file using TTF fonts.
ST-GUIDE output is only possible when using NVDI 5.xx, older versions can't
catch the output and send it to the Mac printerdriver. A way around this

problem is to "Copy" the text instead of "Printing" it, the copied text will end up in the clipboard from where you can drag it onto the printer icon or edit it further in a text editor....

>Not sure which CPX module you're talking about though. Perhaps I haven't
>installed the relevant one.

NVDI installs two CPX files, PRINTER.CPX and NVDI.CPX, the latter isn't really important, but PRINTER.CPX is a necessity. If you've deleted it then install NVDI again, make sure you install it from scratch (delete all NVDI relevant files first...)

If you're experiencing further problems, get in touch with me via personal mail, I'll guide you through the setup and attach a couple of screenshots, a couple of pics can tell (show) more then hundreds of posts ;-)

Cheers from Belgium
Dennis

Hi Hallvard,

>I'm getting a little confused again, because I'm not sure what you're
>specifically referring to: is it "ASSIGN.PRG" (which configures the
>"ASSIGN.SYS" file on the boot drive/partition)?

No, I'm referring to the "instprnt.app" which is (should be) located in the
NVDI tools folder on your boot partition.

<snip>
> 08p SCREEN.SYS
> 09p SCREEN.SYS
> 10p SCREEN.SYS
> 22 MACPRN.SYS
> 31 META.SYS
> 61 MEMORY.SYS
> 91 IMG.SYS

Yep....22 MACPRN is the one we're looking for,
Since the Epson itself is not defined in ASSIGN.SYS, this setup should work
properly calling up the Epson Mac printer driver whenever you print using
GDOS and/or GEMSYS routines :-)

>Unfortunately the printout was only in black/white -I managed to print
>the same file in colour from my Mega STe connected to the same printer.
>Perhaps the NVDI printer driver doesn't work properly with colour
>printers.

If the whole lot is set up properly, when printing with NVDI, the Mac Epson
printer dialog should pop up, inside that dialog you can set the printer to
print in colour....
What it comes down to is that the NVDI settings are not used, the settings
of the Mac Epson driver are used. All that NVDI does is to "hand over" the
data to the Mac printer driver. But, like Derryck already mentioned, the
settings can be changed independently by certain apps, that's why the dialog
pops up prior to printing ofcourse...
You can also reach the Mac Epson printer dialog prior to printing with the
PRINTER or DRUCKER.CPX, instead of the normal NVDI printer settings dialog,
the Mac Epson printer dialog will pop up, where you can then adjust all the
necessary settings.

Cheers from Belgium

Ive tried a basic 16mhz from the shiter direct to the 1772, this alone does not work so I can only assume the 1772 can't run at this. When I goto format a disc it gets to around 5 tracks and then comes up with a error, then comes up with random errors throughout the format. I tried many discs/drives same problems just random faults. The board I did looks a little like the one on lydons page since I also used the 151 IC. Though I used another IC to set the 6ms rate too.

eiffel pages recently updated for a new release 1.0.4.
this one was designed by precious help of Didier Mequignon
from the eiffel 1.0.3 core.

Features are:
-support for two DB-9 standard joustick
-IKBD instructions compatibility near of 99 %
-ventilator command with temperature sensor
-Auto update capabilitie from GEM application eiffelcf.app
whithout to erase now the PIC each time. You program this
one just one time with v1.0.4 and that's all.

Occasionally, you will come across a SCSI drive that, for some reason, will not mark its bad sectors. I have one of those rascals on my TT as we speak.

Thanks!

You helped me double

>ps. have you tried the Calamus 2002 lite version on your pc? This is the
>shareware version of Calamus. It comes for pc, Mac and Atari.
>See http://www.calamus.net

I downloaded this version. Much less windows integration than
Calamus 95, but on the other side, the problem files load with this version.

The returned file, You send me:

Calamus 95 has difficulties with it. Takes forever to load, does not
complete
load. "Program not responding"

So I can do all the job with the 2002 lite version.

>different types of printers.

Hi Hallvard!

Perhaps you hould look a little harder! In my ST-Guide.inf there is:

# Whenever 'Print' is selected output is sent to the Clipboard and
# re-directed to this listed application for output:
PRINTER=E:\IDEALIST.3_9\IDEALIST.PRG

So you can print via IdeaList, or for that matter any text editor
that makes use of the Atatri clipboard (though only one page or
a set of lines at a time - for the latter drag out a block, and
when you release the mouse button you get the option of 'Copy'
(to clipboard) or 'Print'. At least you do on the Atari - don't know
how it works on a Mac with MagiCMac.

That 6ms is always a pain, the best cure is TOS 2.06. It is weird that you are having alot of wd failures. How many boards have you tried this on? Also you might want to try a seperate 16Mhz crystal.

How many hard drives have you marked, and how many got better? NONE get better.

Whilst it is true that the old MFM's etc usually ship with a small number of factory Identified bad sectors (and the number is very small - typically less than 10), that is entirely different to a drive which suddenly starts growing new, non-factory bad sectors. Say you mark out all the "new growth" today. You will find that within a short time a few more have shown up, which you can then mark out (and kiss goodbye the data they were holding at the time), and so on ad-infinitum. You can continue to fight a loosing battle against sectors going bad until the day the drive dies completely, but why would you put valuable data on a storage medium you cannot trust?

The principal is: once a drive starts developing new bad sectors, it will continue to develop them on a regular basis. As such, the drive is unreliable for it's designed purpose of holding data, and should therefore be replaced.

Mark

Hmmm. I'll have to ask him about his version of ICD. Maybe it _is_
corrupted. And if that's the case, simply reloading it from a backup
should solve his problem. Thanks for mentioning it.

Of course, I'm assuming he _has_ a backup. I know some people don't
ever bother with that; unlike myself, who has so many backup copies of
everything that I'm running out of room to store them all!!!

Well, I did too, right after posting the first message here. No reply yet, but I'm sure they get a ton of e-mail. Of course, I wouldn't think they'd get _too many_ e-mails from Atari users, but who knows?

However, since they brought up the original question, I would think they'd be more likely to get back to the folks that write in about it.

Anyway, I'm just thinking, best case scenario...

Let's suppose they write back to some of us, and ask about getting someone on the show to demonstrate what Ataris can do these days. What sort of things would we want to show them?

Certainly that we can surf the web, with CAB. But do we want to demo other browsers, e-mail clients, etc?

Would we want to point out some of the better Atari-based web sites; including those that are hosted on an Atari?

What about showing them that we have CD-RW capabilities, and mp3 players? And what about alternate OSes - MagiC, Mint? And what about the Atari clones?

Again, this is a best case scenario, that they'd be interested in something like this, but even if they only wanted to do a short segment on the show talking about Atari web sites (without a guest), what are some of the best Atari sites they _need_ to see?

I think it might be a good idea to have input from the people here - who are really the heart of all things Atari these days in my opinion. That way, should any of this happen, we'll be able to best represent the Atari scene today.

Any ideas or suggestions?

Typically, that happens when the part of the drive put aside to hold the bad sector remapping data is, itself, bad.

Typical cure: bin it. You can fight with the OS's high level bad sector mapping functions to try and get by it, but the fact remains, the drive has hardware leverl faults that shouldn't be there, which is a sign that it is getting sick and shouldn't be relied on.

Which is what I'm planning on doing now that I've found a local outlet for cheap used SCSI drives.

Per Mark's post, I've done the reformat and lost data using the hard drive software a number of times.

If I understand correctly, it sounds like you have the Windows version of Calamus 95, not an Atari version using STEEM as an emulator.

This version was written for Windows, and when it came out there were a lot of complaints from Calamus users who had moved over to Windows. The Atari version was much more powerful in just about any aspect of the program.

MGI actually pulled it from the shelves and were working on the successor. They shelved that project. Now that Ulf Dunkel and Invers Software I wouldn't be surprised if they eventually abandon all emulation of Calamus on the Mac and Windows platforms and produce versions for each platform. It would make their life easier when it comes to making the Atari code run on a different platform.

Ok, the problem this drive had (megafile 60) is that when using Supra's utilities to format the drive all was fine. Then when it tried to mark bad sectors, they ALL came up bad. That is NOT possible! This tells me that Supra's utilities are trash on factory Atari hardware. I switched to HDX 5 and AHDI 6.06 and all is fine now. The drive is stable and no lost data. I am a little cautious since it happened and I'm keeping my data on the Supra 30 with daily backups. Both are powered up now for the last 4 days without incident. Occasionally run a diag program to push them a little, again, no incident.

Now, I agree with bad sectors mulitplying on a drive (saw it on more than one occasion with the MFM's, not much with the RLL's) and know that total failure would be a given. But, I suspect that those cheesy interface cards Atari used in the Megafile may be a little at fault. I mean, come on, you can change the device ID to any number as long as it is 0? Talk about having an open mind for expandability! :>)

The equipment is a minimum of 14 years old. It's expected to have failures!!

Jon

And I thank you all for the info!

Hi,
I'm looking for SCSI ethernet adaptors in order to create software to use
them on Atari computers with MiNTNet. An Asante device would be ok (I hope
I'll manage to make it work on Atari computers), but I'm also looking for
any other adaptor.
If you have one of these adaptors, please make me an offer. (I live in
France).
Best regards.

14 years is good. And yes the controllers aren't much cop. AHDI is slow but pretty good. ICD is ok with those drives too. As far as all comming up bad, it can happen. But not right away. I fix WC's all day every day, we get at least one machine ever 2 weeks with bad sectors. Seagates are pretty good, WD drives are the most prolific bad sector creator's I have every seen. Won't touch them. Any way all is good, hows the fan on the Megafile?

Calamus SL 2002 lite is not a plain pc program. It does run under
Atari-emulation but users will not notice that at all.

Very likely pc Calamus 1.95 is not compatible with Calamsus SL 95.

AFAIK, Invers will not develop a plain pc or Mac version because this
would involved too much work. For the Mac platform they probably will
develope a Calamus version which holds an imbedded Atari-emulator (very
likely MagiCMac). Lots of Mac/Calamus users are asking this because they
dislike very much the Atari environment. Remember most Mac/calamus users
have left our platform long time ago.
In the future I doubt there will be a Calamus version which will run on
our platform even with MagiC.

The same for pc. The commom Calamus version for pc comes with some kind
of imbedded emulator (Stemulator and not STEEM, correct my if I'm
wrong). pc-users doesn't notice they run actualy under emulation.
Calamus just acts like a common pc program.

6ms aint a problem with the board I did. I have tried it on 3 ST's though only testing the 1772's on one ST, I think I will try another ST to see what happens. I have also tried a 16mhz crystal. My board worked great on a STE though the 1772 is proabably a latter version of the 02-02 which will work. all other machines I have are ST's proably early ones.

According to the newsticker I got via email, they are porting bits and pieces of the Mac version with some parts already running natively under MacOS code. Ulf uses the abbreviation "resp." in this newsticker, and I have never figured out what the complete word is. <G> So I really can't tell what is going on with the Windows version.

> In the future I doubt there will be a Calamus version which will run on

Agreed. Sadly, the Atari platform is headed for extinction.

I think we are talking about the same program. When you search on Google for STEEM, the web pages all call it an STe Emulator. I know I got an email noting that the version embedded with Calamus was a custom version of the emulator, and I'm sure the word used was STEEM.

::chuckling:: Not that it really matters, right? <G>

<VBG> Which users? I suspect Windows users will notice things immediately since they are presented with the Atari Calamus menu bar. And when you go to close the window using the "X" close button in the window you get a warning message about doing this and losing your information. Atari users won't (or at least shouldn't) have a problem as long as they forget their new windows habits and remember their Atari habit.

I have to admit, I sure like the simple easy Atari interface over this #$^#&#%^&!#^$ Windows interface. <G>

Ok I reread the Newssticker.. it says that an immediate portation of the
complete Calamus system doesn't make sence, because this would take
several man years without taking the developement any further.
That's why Invers decided to use a "creeping portation" (sic).
The already ported some stuff to run native under Mac *resp.* windows.

resp = respectively??

Other parts still need the according wrapper which runs the original TOS
code under Windows/MacOS.
So I was a little bit wrong. I do know however that lots of Macusers
want to get rid of MagicMac. They want something simular as the pc
version. Whether Invers will do that or not, I don't know. I hope they
will do so

Not the Atari platform is headed to extinction but the Atari version of
Calamus.

Nope we don't talk about the same emulator. STeem and STemulator are two
different emulator (see Google). STeem is freeware and AFAIK more
suitable to play Atari games, STemulator is payware. However I'm not
quite sure which emulator is embeddeed. I think it's STemulator

Agree, pc users will notice the non-pc type GUI. What I meant is that
people won't see that there is an emulator running like one see when one
uses MagicPC/Mac..
>
> I have to admit, I sure like the simple easy Atari interface over this

At first start, I noticed that SL2002 looks much more like
the ATARI version, but I had really no idea, that this
is an ATARI emulator until I have seen the posts about it.

Source record: 31612

Hi Mark

You suggested binning the drive when the first duff sector appeared, this was bad advise, if there is a repeat problem then it should be investigated further, but dumping at the first sign of trouble is bad advice!. And actually the drives I cycled were cured, obviously the problem was not a physical one, most likely a power or signal glitch occurred during its use, lucky I didn't bin them at the first hint of trouble.

| How many hard drives have you marked, and how many got better? NONE get
| better.
|
| Whilst it is true that the old MFM's etc usually ship with a small number of
| factory Identified bad sectors (and the number is very small - typically
| less than 10), that is entirely different to a drive which suddenly starts
| growing new, non-factory bad sectors. Say you mark out all the "new growth"
| today. You will find that within a short time a few more have shown up,
| which you can then mark out (and kiss goodbye the data they were holding at
| the time), and so on ad-infinitum. You can continue to fight a loosing
| battle against sectors going bad until the day the drive dies completely,
| but why would you put valuable data on a storage medium you cannot trust?
|
| The principal is: once a drive starts developing new bad sectors, it will
| continue to develop them on a regular basis. As such, the drive is
| unreliable for it's designed purpose of holding data, and should therefore
| be replaced.
|
| Mark
|
|
| "Steve Sweet" <stevesweet@freeuk.com> wrote in message
| news:1034096874.28487.1@despina.uk.clara.net...
| Hi "Mark Bedingfield"
|
| What scare-mongering crap!. If bad sectors are a problem for the first time
| with a particular drive then a re-format with mark-bad followed by a
| re-partition will usually hide them from view. Think before you 'try' to
| help!.
|
| | A bad sector is like cancer for a hard drive. If you get one they will
| | spread. I recomend binning it. Get a scsi controller and drive. You can
| | map out the bad sectors (don't leave them), and you may get a little use out
| | of it until one day ....

All true. On the other hand, Rudolphe should be given lots of slack in my opinion. 1. The CT2B is the best accelerator I've seen. He's proven that he can make a good product. 2. He's the only game in town (if you're using Cuebase Audio.) 3. Making anything in the Atari world today has got to be a real labor of love, not for money, or for appreciation!

2785. Archiving Atari ST Disks to CD-ROM

Newsgroup: comp.sys.atari.st
Date: 2002-10-09 21:50:43 UTC
From: Charles Richmond <richmond@ev1.net>
Message-ID: <3DA4C02C.7E6F559D@ev1.net>
Source record: 31745

I have literally a medium sized cardboard box full of
Atari ST floppy diskettes that I need to archive onto
a CD-R. I should be able to read the disks alright,
either with my ST or an older Mac...and the CD-R will
be in ISO-9600 format.

My question is: Does there exist a "disk image" format
that I should use for each disk...maybe a .dsk format???
I will probably have room to put each disk on the CD-R
more than once...

Why not just use the ".ST" disc format with ST2DISK, that will copy a disc
image for you to put onto CD. A mate of mine is copying over 3,000 discs to
CD at the moment though he is doing it file by file into folders on the CD.

Everyone,
I also e-mailed the guy from TechTV. I have not
recieved an e-mail yet. But, I think we should all be
hopefully optimistic that they may follow through with
some sort of segment on our beloved computers. BTW, I
run the ST Web-site FAQ and seem to be having trouble
getting onto Anodyne Software's web-site. It comes up
with a list of ISTOP web hosting web-sites and there
are a ton of them there, I found Anodynes web-site
addy but when I click on it it just gives me the same
list. Anyone have an updated web-site URL???? Thanks
in advance for the help.

Thanks,
Carey Christenson

I agree!
I've a CT2b and am very pleased with it.
Rudolphe is the kind of person that will deliver what he has promised.
Sometimes it takes a little longer than we all would like; but rest assured he's doing all he can to deliever something to you that is indeed worth your money.

In my experience over the years...
Rudolphe DOES answer his mails and messages. It sometimes takes several days due to his busy schedule...but he will reply (at least he always has for me).

Maybe, but if you are right, it still doesn't make any sense to me as to what Ulf meant.

>
> Not the Atari platform is headed to extinction but the Atari version of
> Calamus.

I would have to disagree about the platform. A vibrant "anything" draws new people to it and the number of people involved increases. The opposite is happening with Atari. I'm not happy about that, and I waited as long as I could before changing platforms.

You may be right. One of these days I may go ask in the Calamus forum just for the fun of it. <G>

I remember when MS came out with Windows 95. They made a big PR thing about how much easier to use it was than Windows for Workgroups 3.11. Almost no one agreed with him. They haven't done that since! <G>

Then there was the time when Mr. Gates (or so I've heard) bragged that some new OS they were bringing out fixed 6,000 bugs in Windows 98. Someone asked why there were 6,000 bugs in Windows 98! No answer. <G> I don't know the truth or fiction of the Windows 98 story, but it sure sounds good! LOL

I've decided to stick with 98 until it won't do what I want, or the computer dies. No longer interested in paying money to always have the latest thing. It's just gotten too @#$^@#$^@ expensive to do that. Especially when there's nothing new in the market place I'm interested in.

Except for Calamus, but I can no longer afford that either as I have no use for it anymore. :-(

The fan is new.... One of the first things I replaced. I was aware of heat problems with the case (yet another faulty design) and put a high flow fan in there. One drawback is it sounds like a jet when it first starts up and a small prop job while running. Better than the alternative.

I'm still amazed that this hardware is running without a problem. My 4 pc's have, in the last 3 years, lost hard drives, video cards, and cd's.

It's amazing how a machine that cost so little, lasted so long...

I offered the loan of the iron I use for soldering large chunks and bowden cables etc, but he said that he wouldn't be able to heat it up on his electric stove ;-)

Isn't Fluxite corrosive anyway?

Cheers

>Not the Atari platform is headed to extinction but the Atari version of
>Calamus.

It's not really usable to its full potential on an Atari, even with a Falcon with a CT2 and plenty of RAM (I dare say a CT060 with a graphics card would be much better). Anyone using a Falcon would be well advised to read the FAQ about the necessary change to the sys file that's needed with recent versions of Calamus.

Cheers

>a CD-R. I should be able to read the disks alright,
>either with my ST or an older Mac...and the CD-R will

A worth-while project, I started a similar one but the pile of disks that are still waiting to be copied doesn't seem to be shrinking :-(

>My question is: Does there exist a "disk image" format
>that I should use for each disk...maybe a .dsk format???

All I did was make a folder for each disk, with perhaps a Disk1 etc folder within if it was a multi-disk set, and just copy the floppy disk contents over (this is all on a spare partition which will get copied in one go).

No need for anything else unless you're trying to copy protected stuff, someone else will have to advise on that.

Cheers

I agree that more information should be coming from him, since the
CT60 is so far past the estimated release date. Never the less, if
there are problems at this point, impatience from us will only make it
more difficult for him to complete. By the way, with all due respect,
I think that a persons past work does have a bearing on what he or she
is doing now. In my book,
Rudolphe's "track record," and products are excellent.

> > today has got to be a real labor of love, not for money, or for

>
> Thatï¿½t not true in all.
> Some people prepayd this fun, they wait for results in more as an one
> line messages.

Yes, I know. I'm one of them, and I think I was somewhere between
50 - 60 on the list who have prepaid, and I have prepaid in full. I'm
just a musician, and I know that I have none of your technical
expertise, so perhaps you have a better idea than I about what
Rudolphe may stand to make from the 150 or so of these that he ay
sell. But it seems likely to me that it certainly won't be a fortune!
Whatever the case may be, I think that what we say to each other
has a huge impact on each other. Frankly, my patience is wearing thin
too, but I think that extra patience and understanding on our part
will actually help the CT60 become reality.

Peace!

Wayne.

(BTW, Rudolphe's web site is back up. I was hopeing it was down for
some sort of update, but no such luck. Keeping my fingers crossed!)

For those whith these machines, after replacement wiper blades for the drum kits, New ones are available from Static Control in the USA. They are sold usualy in packs of 10. So it would be better off if someone in a position to purchase a whole pack and sell them individually could do so. LB1306 & LB1306 blades are available, new, but drums are only available for the SLM605. The drum of the 804 due to its size i guess should last the life of the machine if looked after.

Anyway ask if your interested to know more.

Wiper blades keep coming in discussions about this printer, yet I'm not sure what one is. Am I correct if I guessed it's the felt like wiper that fits at the back of the printer?

And a little more info about Static Control? You get a lot of info about stopping that problem in clothing when you search just on that phrase. <G>

2808. ADV: Bravo Sierra! Atari Sales, Support & Service!

Newsgroup: comp.sys.atari.st
Date: 2002-10-11 00:30:28 UTC
From: Bravo Sierra Computers <atari@aracnet.com>
Message-ID: <Pine.LNX.4.44.0210101725180.5081-100000@shell1.aracnet.com>
Source record: 31617
Cross-posted to: comp.sys.atari.st,or.forsale,pdx.forsale,rec.games.video.atari

Hi, I'm Ben Smith of Bravo Sierra Computers! Your Benefactor, an Atari Dealer. Offering Sales, Support & Service of Atari HardWare, SoftWare, Books & Accessories for the Classic Atari 8 Bit and Atari ST Computers plus the 64 Bit Atari Jaguar Game System. I am a Reseller of Used & New Atari Collections! Much of which were the Treasures of Former Atarians, Locked away in Dungeons, now given New Lives, offered to be sold as New found Treasure, back in Circulation in the Atari MarketPlace. Hidden and Forgotten, Now set free from the secret hiding places. Atari Heaven where former Atarians had left them to Die. Saving Wondrous Collections from being irretrievably Lost! As well as Saving entire inventories from defunct Atari Dealers, much of it +NEW in the BOX/BAG! After Languishing in Forgotten Warehouses, long abandoned by retired Atari Dealers!

I love saving my customers money! I mainly use Postal Delivery! I save money for my customers when using Postal 2-3 Day Priority Mail & Global Priority Mail. I use Packaging supplied by the Post Office for free and Pass on the savings. I sell Atari, I'm not in the Business of Profiting from Marking up on the cost of Shipping! And just like the Postal Service I avoid making promises I cant keep. The Post Office sends Packages by 2-3 Day Priority Mail. They don't promise 2-3 Days but they have a Good record of Following through! Once I receive payment, your order usually goes out the same Day! This is not a Promise, but like the Post Office I have a Good record of following through! Ask my Customers! I also have Libraries of Reference Books for the Classic Atari 8 Bit and the Atari ST Computers! I have ways of saving Money on Postage by Sending it Book Rate. I also have some tricks for saving on Postage when Mailing outside the United States! I Ship Atari anywhere the Law allows! If you dont come to me, I cant save you any Money!So check my HotLinks below, E-Mail me at atari@aracnet.com or call Ben anytime at (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

Got Atari Questions? E-Mail or Call Ben 24Hrs, anytime at (503)256-9974!
http://www.aracnet.com/~atari/numbers.htm Phone contact info and Hours!

>
>My question is: Does there exist a "disk image" format
>that I should use for each disk...maybe a .dsk format???
>I will probably have room to put each disk on the CD-R
>*more* than once...

Hi

Sounds like me that.. Been doing something similar for a few weeks now
and it must be the most boring thing you can think of.... erm! Maybe
not:))

There are several programs you can use. When i started shifting all the
pd software i have over to cd-rom, i used to use fastcopy pro's disk to
file (.dim) tool. I also move the files onto cd as well, so that i could
located a specific file if someone was having problems etc.

Fastcopy pro is goodish, but i cant get the bugger to run on a Falcon.
So, I have settled with magic shadow archiver (.msa) along with the
normal files.

OK msa has a few drawbacks, but it does run on a falcon AND 99% of
atarian's have it, which will enable me to send a disk via email. It
also doesnt like read errors, it gives no retry option and for some
disks - mainly demo's - it cant do due to strange formats.

There is one method of copying disks to files, but this requires
hardware:) and requires the same type of hardware to recreate the disk,
and that is Happy Computers Discovery cartridge.

Is there any software, besides the discovery cartridge, that allows you
to copy non standard formats into a text file that can be sent via email
etc? I would like to stick all the demo's i have on cd-rom, so that
other people could recreate the disk without special hardware - the
discovery carts arent exactly cheap and easy to come by.

thank you for this hint, but no one of the drivers worked :-(
So I started to disassemle the modem port connector of this MIDI Extension,
and there were _no electronic parts_ inside, only the MIDI- Cable is
connected to some pins.

So maybe this part _cannot_ be working?!

Use the Export DRV, read the Cubase manual to activate and use it.

Nice zoo. I've been there a few times (as visitor).
Maybe the Artis can set up an EEP (European Endangered Species Program)
to save the European Atarians from extinction.
I believe similar programs exist for Australian and North-American zoos.

>resp = respectively??

Yes, it is Ulf's literal translation of 'bzw.' (= beziehungsweise).

I prefer using 'or xxx respectively' where 'respectively' refers
to alternatives mentioned earlier. So it means it runs under Mac
OS on a Mac, and WIndows on a PC. Simple really!!! :-))

>> > The same for pc. The commom Calamus version for pc comes with some kind

>> > Calamus just acts like a common pc program.

Well, since it runs so much faster on the Atari-emulating PC,
and generally Calamus uses its own graphical user interface,
I wonder if Windows users will really notice much difference from
native Windows apps?? Very minor ones, I'd have thought....

the wiper blade im talking about is the rubber blade in the drum kit that yellow's and goes floppy. This causes imaging defects, such as repeditive images down the page, can cause light print when failed and will make the pages dirty aswell.

The felt strip you are talking about is no big deal, you could have the felt replaced at any toner remanufacturing place. ive got boxes of it at work. Its soaked in silicone oil and lubricates and cleanes the fuser roller, removing toner buildup and the lubricant allows labels to pass through with out delamnating and getting jammed in the fuser.

I'll find the website for static control.

it's new and it's still in a state of 'work in progress' but for now you can use it and check it out for old ST/e/Falcon/TT software and some Macintosh software too.

an upload/download ratio has been set up - so if u see anything then upload a file first and download till your hearts content :)
Please upload to the "user uploads" folder, thanks (atari/mac, movies, pictures, mp3's, anything !)

Enjoy!

2825. Ultimate Muzak Demo 8730

Newsgroup: comp.sys.atari.st
Date: 2002-10-12 10:55:51 UTC
From: Grazey <grazey@tphf.karoo.co.uk>
Message-ID: <ao8umd$8sp$1@newsreaderg1.core.theplanet.net>
Source record: 31634

Hello

This is a message to announce that the Ultimate Muzak Demo 8730 is
released.
A music demo for the Atari ST which
features over 95% of all known tunes!! Well it's finally released, it
runs on the Steem emulator (http://steem.atari.org) and of course an ST/e.

Press Release
============

Yeah, finally!

The largest music demo ever written finally hits the streets. Started in
October 1998 , beta version released at the ST News Conference / Holland
in December 2000. Now the full version is released!

Info :-

Works with any 1mb or more ST/e , semi compatible with Falcon ;-)

4646 tunes
182 different music composers
Hard-Drive installable
OR 10! Floppy disks (yikes)
Steem emulator compatible
Features a *21* minute intro including the longest chip tune ever written.
Hidden Screen
Many un-released tunes

Go to http://phf.atari.org

Grazey/Psycho Hacking Force

2826. Follow this link for Cubase Lite

Newsgroup: comp.sys.atari.st
Date: 2002-10-12 11:11:53 UTC
From: sonik@whsmithnet.co.uk
Message-ID: <3da80379_3@news2.vip.uk.com>
Source record: 31635

Hi folks

Just something for the bloke who was asking for a link to a
cracked version of Cubase. Follow this link and it'll take
you to a site where you can download Cubase Lite which is
now freeware. Cubase itself is still a commercial entity
and therefore you are obliged to buy it, even though Steinberg
no longer support it.

http://tamw.atari-users.net/cubase.htm

Go for it if you're interested.

Cheers
Al

ps there's loads of other Atari MIDI stuff on this site.
It's a veritable treasure trove and a vital Atari resource.

It's most likely included with the demo version of jinnee FWIW.

>utility within the GEMSYS/GEMDESK folder called "print.ttp", but
>couldn't get it to work.

I think that's meant to print using GEMDOS anyway, so that's probably the
problem.

Off topic but might be handy for others:

Under the Atari MagiC OS/jinnee I have this set as a parameter for
PRINTER.TTP under "Applications":

%$p C:\GEMSYS\GEMDESK\FF.TXT

The text file FF.TXT contains a formfeed character and ensures that part-
pages get printed and ejected by the printer.

>In any case, Idealist is a better solution as it allows me to use
>different fonts.

Agreed.

Cheers

Derryck

Well I have CDISO from Anodyne and it works great. All the CD's
I have made using it work on my STe and can be read by any computer
from the PC to my STe.

Nice to have a new Atari ftp-server but I would be much nicer if the
server would be usable with the Atari ftp-clients.
For instance aftp has servere trouble to list the contence of the dirs.
IMHO this comes because you use dir/file names with spaces in the name.
That might be a common pratice with Mac OS servers but certainly not with
Unix servers.
Please convert the names to follow the rules. Even ftp.apple.com or
the.ausmac.net doesn't have names with spaces.

I've had lots of users loggin on, but you're the first to reply/email.
Thanks:)

The site will get bigger & better soon, and even then it will still be
available free to all. But i'll soon be changing the login procedure by
creating users that will have their own passwords. For now, enjoy
anonymous loggins

Thanks
Steve:)

ps, no one's uploaded anything to the "user uploads" folder yet!! :-\

Hi Derryck!

No, it's not! Basically it seems to be the same stuff as was used
in the original multicore solders (don't know what they use now).
Spare flux can form an insulating crust after heating, but isn't a
problem. It's great for cleaning solder-iron bits too - just
plunge them in and you get a nice, shining tinned bit!

yes, i've figured this one out for myself last week at work.. i use a PC
there and this had troubles from the command line, i had to enter the
name in quotes """" to get it to work.
I'll be changing the names sometime in the next few hours:)

Guess you got a cheap and nasty lead.

Export DRV definitely works with the correct lead, which I can supply.

Email me for details if interested.

Yeah, it's about time for me to take on this project as well. I've
got quite a large box of floppies too - mostly DD floppies from my STE
collection, although there are quite a few HD disks as well (early
Falcon stuff). I'm planning to make use of Anodyne's CDISO too.

And after I finish that, I'm going to use a program called EPS Wizard
(that runs on STs and the Falcon), which allows one to read and write,
as well as backup to hard disk, DD floppies that are used with the
Ensoniq EPS sampler (keyboard), since I have almost as many floppies
for my EPS as I do for the STE!

My only question: Can anyone suggest a way to get the motivation
needed to take on this project!?!?
;-)

2841. Seagate Hard Drive

Newsgroup: comp.sys.atari.st
Date: 2002-10-13 04:03:09 UTC
From: fried@achilles.net
Message-ID: <751b0ec4.0210122003.19242847@posting.google.com>
Source record: 31650

I got a Seagate Barracuda 4.3 HD on ebay and I can't get HD Driver
to "see" it on my system. It is a fast and wide SCSI HD which I
believe is also called SCSI 3? Anyway I got an adapter to make it
connect to a 50 pin cable and put the HD in my SCSI external case,
which is connected by another cable that is SCSI 1 on one end and
SCSI 2 on the other. Could it be a problem with all these different
SCSI standards, or does HD driver support SCSI 3? I'm using HD driver
7.6.
Any help is appreciated.
Thanks, Mark

Yes, HDDRIVER suports SCSI-3. Have you already tried the current demo
version 8.1 of HDDRIVER. There were numerous changes wrt to SCSI since
version 7.6.
Ensure that your adapter *actively* terminates the unused upper 8 data
lines of your cable.

I went through this (on a Mac as it happens). I thought that it was the
adaptor's responsibility to configure the drive (in this case a 68 pin job)
to the right configuration for an 8 bit data bus, single-ended but had to
grab the manufacturer's data sheet and a few jumpers and do it myself.

There's no reason to suspect the various standards you/we have.

Cheers

Derryck

Source record: 31657

Hi Pete

| >Isn't Fluxite corrosive anyway?
|
| Hi Derryck!
|
| No, it's not!

Yes it is!!, don't make me cut and paste this into a recursive macro!!. 8~)

|Basically it seems to be the same stuff as was used
| in the original multicore solders (don't know what they use now).

A large IF transformer manufacturer used 'savbit' multicore shitte some years ago to produce its coils and the result was that after about 2 years all the coils went O/C at the point the solder was applied. Caused some nice intermittent faults for some months in other cases.

| Spare flux can form an insulating crust after heating, but isn't a problem.

Its far from an insulator and causes major problems in high humidity environments, in these conditions it will eat through copper conductors, that's cables or PC tracks, that's why manufactures these days wash all soldered boards to rid them of any flux residue that didn't evaporate in the flow tanks.

|It's great for cleaning solder-iron bits too - just
| plunge them in and you get a nice, shining tinned bit!

Just what you'd get from immersion in sulphuric acid.

You might need to do a low-level format on the drive and set various parameters (particularly the sector size) correctly. I got a ~4GB SCSI disk off of eBay a few months ago, and it had been used in a UNIX system that set a peculiar sector size. It wouldn't work in my TT until I forced a low-level format with a reset of the sector size to the standard 512 bytes. I don't recall what I used to do this, but I think it was an old DOS utility (I used an x86 box to do the reformat).

Now that I've been informed what Tango Uniform means, I'm hopping Bravo Sierra is around for a long time. They provide parts, software and hardware for those nice little computers known as Atari.

If the Bravo Sierra posts annoy you so, why not just do a "Block Sender" option on your computer?

Don
Retired SysOp of the retired Bear Cavern BBS. It ran on a Mega STe 4, "Wedding Cake".

Thanks for the phonetic alphabet lesson. Back when ol Donald wore kaki from the late 40's through the middle 50's seems to me it was a bit different. I think it would have been Tango Uncle ???? I'm doing pretty good in remembering my serial number.<G> For the longest time I remembered my carbine number but that faded with time. Yep, carbines in the 386 Field Artillery Battalion, 104th Division.

Don:

Perhaps you're a bit biased. COnsidering that so many users pitch a fit if someone violates the FAQ, why do you think this guy's COMMERCIAL POSTS are OK? He repeatedly clogs this NG with endless dribble about how nice a guy he is. It's like reading a Beanie Baby sale post, agrh!

Sorry for the rant, I'm just tired of the same old crap, recycled ad-nauseum.

Glenn W.

You don't really open every message and read it do you? Did you every think
that maybe others are tired of reading criticism notes? If you don't want to
see messages from any particular individual, do a "Block sender" and your
problem is gone.

BTW, you know every time you voice your concern about Bravo Sierra you quote
the message that bothers you. Share the guilt.<G>

Take care,

Ciao,
Don

If a drive is not "seen" it has definitely nothing to do with the sector size. The physical sector size is only relevant when trying to read/write data. If a drive is not recognized it's a hardware-related problem, usually wrong termination or bad cables. You are not able to format a drive that is not "seen", by the way.

2859. Matrix M128 card drivers

Newsgroup: comp.sys.atari.st
Date: 2002-10-14 09:00:07 UTC
From: _Fatman_ <louis@bbst.net>
Message-ID: <8d1lqukovp1mupmn3c40c445f7jt8jurhk@4ax.com>
Source record: 31668

Hi all,

been a long time since I was active in here :-)

I've been maintaining an incomplete Matrix support page on my website
and yesterday someone mailed me about getting Matrix M128 card
drivers, for a card he bought without drivers (now, why are ppl
selling cards without drivers in the first place?)

Is there someone out here willing to send me these drivers or knowing
where they can be obtained?

The other thing is: my site only has drivers available for the TC1006,
TC1208 and the MoCo, CoCo and MiCo cards...

Perhaps it would be nice to get a complete list of all cards Matrix
has ever produced, possibly with all the drivers that have been made
for those cards and make them available on that site too. Even after
somany years I keep getting emails regarding this Matrix stuff.

TIA,

2861. Re: Starlord in Daily News

Newsgroup: comp.sys.atari.st
Date: 2002-10-14 19:41:24 UTC
From: Starlord <starlord@in>
Message-ID: <05Fq9.169$f67.108306530@news.inreach.com>
Source record: 31673

And you can see why I've not been able to get that TT keyboard too, that's been a sinkhole for money and on my budget it's been slim eating too. This month I was planing on contacting you, but my old junker of a caddy gave me a surprise, a dead battery and a blown tire, that used up everything else.

Every now and then I still fire up the TT and move a file or two around to make sure it's still running.

Oh ya, this stupid intel box had to have a new mouse too, to bad I couldn't use an Atari one on it! That was another $14.00 down the hole.

For those who don't know what we're talking about:

Stargazer shares the wonder

By Charles F. Bostwick
Staff Writer
Thursday, October 10, 2002 - ROSAMOND -- For nearly five years, a burly, gray-bearded man named Dennis Bishop has set up a telescope at a Rosamond Boulevard corner on weekend nights -- inviting passers-by to take a look at the moon, planets and stars.

Bishop, 53, calls himself Antelope Valley's only full-time sidewalk astronomer.

"I'm always amazed at people. They don't bother to look up at night. There's a nightly show overhead," said Bishop, a disabled Vietnam veteran who lives in a mobile home park outside Rosamond. "If I don't see anything good on TV and there's something to view at night, up I go."

After nearly five years of setting up a 4.25-inch mirror telescope he assembled from a kit, on Saturday night Bishop will unveil a bigger, more powerful telescope that he spent four years building.

Bishop said he plans to have the telescope set up at 7 p.m. Saturday at Rosamond Boulevard and B Street.

Mounted on a swiveling wooden base, the new telescope is constructed from a tube used by builders for casting concrete pillars. Inside is a 8.5-inch parabolic mirror that Bishop acquired from a man he met over the Internet who had kept it in a closet for 10 years. Buying one would have cost more than $400.

Bishop is a self-taught astronomer and telescope builder.

"I got a couple books. The idea is simplicity itself. You've got to have two mirrors and an eyepiece and something to hold it all together," Bishop said.

His device is called a Dobsonian telescope after its designer, John Dobson, a Chinese-born, 87-year-old former Buddhist monk. Dobson had decided that ordinary

people should have access to telescopes to help them try to understand the universe. He is known as the founder of sidewalk astronomers as a group.

"If there were a million amateur astronomers with telescopes and they were willing to let a few thousand people each look through their telescopes, there would be a chance for the people in the world who wanted to see to see," Dobson once wrote.

"Other amateur astronomers seek out dark locations, we set up in the light-polluted sinkhole of the city and offer views of the skies to people."

In 1994, Bishop started his own sidewalk-astronomy effort in Hawaii, where he was taking care of his invalid mother. He used a 12-inch telescope, even larger than the one he just built, but he had to sell it to pay for the plane ticket back to California.

Bishop said he's been interested in the stars for as long as he can remember.

As a boy in the early 1960s, he lay in his family's Palmdale back yard and looked up at the night sky -- much thicker and brighter with stars then, before population growth brought many more bright lights that interfere with the view.

Still, the Antelope Valley is blessed with clear skies most of the year, he said.

Bishop said he sets up his scope in Rosamond nearly every weekend, as well as on most weeknights during summer. Some nights 12 or 15 people will stop, other times just one or two.

One busy night last month, a rocket test from Vandenberg Air Force Base lighted up the evening sky with its vapor trail.

"I knew immediately what it was. For the next 30 minutes I was the most popular guy in town. People who never stopped before were stopping me and asking me what it was," he said.

The Lone Sidwalk Astronomer of Rosamond

2863. TeX to SLM

Newsgroup: comp.sys.atari.st

From: Jim DeClercq <jimd@panix2.panix.com>
Message-ID: <aof7oh$rn8$1@reader1.panix.com>
Source record: 31671

I am missing something simple.

I use TeX for several things, and DVISLM.TTP does nothing but
print a blank page. The DVI file is fine, and there is a workaround. I
print to file as a lj file, and use MagicSLM to go from there to
my SLM804.

I am using the CS_TEX_4.0 distribution, and whatever is in it I have.

Does anyone have a working copy of DVISLM, or a working setup that will
print to an SLM804?

Or, what simple thing am I missing?

Jim

You can try converting DVI file to PS of PDF and then use GemGhostscript.

2865. Just been given a 1040STf

Newsgroup: comp.sys.atari.st
Date: 2002-10-14 20:59:42 UTC
From: bill@newbreedsoftware.com
Message-ID: <2fGq9.39894$lk.864660@typhoon.sonic.net>
Source record: 31674

Well, apparently there was an Atari 1040STf lying around the office I just moved into, and since it wasn't claimed before the last tennants moved out, and obviously wasn't used by them for work, my bosses here said to themselves "hey, Bill's into Atari's - we can give it to him!"

So, I'm now the proud owner of an Atari 1040STf (minus the up-arrow and keypad-zero keycaps, and E and D keys which don't stay on very well).

I have no idea if it works - I found a spare power cord (looks to use the standard type used in today's monitors & PCs), and it appeared to power up.

But, I have no monitor here at work that it could talk to (and no cable), and looking at the DIN plug on the back, I seriously doubt the cable I'm using on my Atari 800XL (with Commodore 1902 monitor) will fit the bill.

My first question is:

What's the best/cheapest place to get a monitor cable, and what kind of monitors can it connect to? (e.g., can I use that Commodore 1902 monitor?)

What's the best way to get files to/from this puppy? I've got a Linux box at home and at work, and I seem to recall the ST line using "MSDOS" style floppy disks, so I suppose I can just use 3.5" disks...
Is there any kind of ethernet adapter for it, or something?

Thanks!

I guess it's time to poke around the ST/TT/Falcon sections of B&C Computervisions and BEST Electronics websites. :^)

(I've got a 2600, 2600Jr, 800, 800XL, 1200XL, two Lynx IIs, and two Jaguars, so I guess this guy is going to round out my collection... assuming it actually works and I keep it, that is :^))

-bill!

The Atari produces analogue RGB at "normal" TV style frequencies. So
depending on the original country this will either be at 50Hz or 60hz,.
depending on the dominant standard. You can switch between the two with a
boot floppy but most suitable monitors will sync to either. Some models
(STFM and STE) had a built in TV modulator and these have composite video in
addition to RGB. You can tell these models as they ahve an additional RCA
jack on the back for feeding the TV arial socket. As its an STf I assume it
has no TV modulator, and so no composite, so it won't work with the 1902,
which from the web appears to need TTL or Composite.

>

If its real old it probably has a single sided drive in it, so it won't read
PC format drives. If it has a double sided drive it will read and write

"standard" 720k (i.e. none high density). The OS is usually in ROM so once you ahev a display you will get a "GEM" desktop and you should be able to format disks. If it will format a double sided it will read 720k PC disks.

As it has no hard drive ethernet is not much use. If you get a hard drive the hardware.atari.org has one solution which I also use, but the ISA Realtech NE2000 clone cards it needs are getting harder to find at junk sales.

Here is a List of Atari ST Hardware For Sale:-

1 x 520STE 1Mb (Interhal Floppy wont read disks)
1 x 1040STE 4Mb
1 x Gasteiner HD
2 x External Floppys
1 x Philips Colour Moitor plus lead
1 x Mouse(may have a second)
Loads of mags(ST User and ST Format)
Loads of floppys
Plus Joysticks
Plus anythink else i find i will include
UK only please.

(Sorry, I don't know what 'TTL' is :^/)

The C= monitor I have (I'm _almost_ certain it's the 1902 model)
has a three-way switch in the front:

COMP - SEP - RGB

> If its real old it probably has a single sided drive in it, so it won't read

Cool.

Thanks for the pointers. I spoke with one of the folks at
B&C Computervisions (I had NO IDEA they moved out to El Dorado, east of
Sacramento. I work in Sac. and have lived in Davis almost as long as they've
been out this way!)

He said it sounds pretty beat up, and since all I'd use it for is
the 'ooh' and 'ahh' factor, and games, I may just end up giving up and
giving it away (or for cheap) + shipping, in case someone wanted it for
parts. :^)

-bill!
I've always wanted an Amiga, instead, anyway. ;^)
Sorry - It's just it's got the Miner Touch! ;^)

Hello Mark,
I'm waiting on an adapator to try one of these drives on my Falcon.
ST34572W
It should work....

1. What computer are you trying to connect it with? Falcon?

2. Check the jumper settings carefully...be sure you've a non conflicting
address jumper set.

3. Check the Termination Power and Termination jumper settings. Some atari scsi
hosts do not supply termination power properly, or at all. In such cases
you'll want to have one SCSI device on the bus supply term power to itself, and
to the rest of the bus. You only want the last device in the SCSI chain
terminated.

4. Open HDDriver Utily and scan for drive ID, if it is showing up there, but not
on the list when you boot, then you've simply forgotten a setting in HDDriver.
Find the dialog where you tell HDDriver what SCSI ID's to scan and make sure the
drive ID is active.

5. If still no luck...try to find another computer somewhere to test the drive.
If nothing can recognize it...maybe it's a bad drive. Given the age of that
model of hard drive...there is a VERY GOOD chance it is still under Seagate
Warranty (free repair if it's bad).

Do let us know if you get it working...I'm hoping to get one of these to work on
my Falcon.

Brian

It's possible to hook it to a VGA for the monochrome mode.
Ask around..I'm sure some of the Atari shops will build you a cable.

To get files to the ST...get a box of Double Density disks...or if you can't find any, tape the hole of some HD ones. Format them on your PeeCee. If the ST turns out to have a single sided drive...then use MSDOS to format it single sided on your PC. You should be able to move the disk(s) to and fro then. You might also check popular Atari Emulation sites...as there are quite a few utilities for moving "disk images" about.

Yes...there are at least 3 ethernet solutions, thoe you'll need a multitasking OS (and enough memory to run it). One of the ethernet solutions requires a relatively modern SCSI host adaptor. In any case...a hard disk would be nice...

Hello Mark...

Just today I installed one of these Barracuda Wide SCSI drives on my Atari Falcon...

I did have some troubles getting it recognized...

I also have a Barracuda ST32550N 2.1gig (NOT Wide) drive on the bus..

I finally got the Ultra Wide ST34572W to be recognized like so:

I have a Falcon with the mini SCSI II cable going to a SCSI I type chasis just like you described.

1. I had the other drive [ST32550N] provide TERM POWER to the BUS, AND to the drive and made sure this first drive in my chain is NOT terminated.

2. I then set the Wide SCSI drive (with adaptor) to get its term power from the SCSI bus.

3. I put a termination block on the end of the SCSI chain. If you don't have an external termination block...make sure the last SCSI device in the chain is terminated.

In essence...it seems like the Wide drive does not like something about the Falcon's termination power (if it provides it at all?).

Having another device on the SCSI bus provide this seems to have fixed it. If you don't have another SCSI device to do this with...try experimenting with the various termination jumper settings on the hard drive.

If that doesn't help, ask on the news groups...there's a way to pull termination power from an external power source (such as the joystick port) if needed...people used to do this with the old ICD adaptors for ST machines and zip drives that do not provide their own termination power.

Hope this helps...
Brian

Best Electronics sells a MultiSync Cable for Multisync Monitors. I use
mine on my NEC 3D MultiSync Monitor. This allows me to do MonoChrome and
both Low-Medium Color Resolutions. If you want to do Composite Video, I
could sell you a VideoKey.

> What's the best way to get files to/from this puppy?

The 1040STF should have a 720K Floppy, compatible with the PC 720K Format.

Yep, and it's TTL RGB, meaning that an on (+5 V) or off (0 V) ist sent
to the monitor for each of the primary colours red, green and blue, as
opposed to analogue RGB used by EGA and VGA monitors. More precisely,
it's RGBI, with an extra digital "intensity" line, giving you a total of
16 colours on a C128 (for which the 1902 was designed, IIRC) or a PC
with a CGA card.

As for the cable: Another poster already mentioned that it is possible
to use a standard PC monitor for monochrome mode. It's easy to make an
adaptor cable with just a little soldering experience. Have a look at

ftp://gem.win.co.nz/hall/hardware/msync_ii.zip

and strip away everything for colour and switching.

Regards,
Michael

Format.

AFAIK, all 1040s (ST, STF, STFM, STE) have had 720k double-sided
drives since the 1040 was released in 1986. (I think Byte mag debuted
it in the (March?) 1986 issue)

Only the 520 (ST, STM, STFM) featured a single sided drive (360k), and
that disappeared in (mid 1989?) and was replaced with a double-sided
drive (STFM, STE). Some STM buyers paid more, and upgraded to a
double-sided drive when they bought their machine (Early 520 STs and
all STMs didn't have a built-in drive, they only had an external
floppy drive connected via a cable to the rear of the machine)

For the pre-STE models, an "F" in the name means built-in Floppy, an
"M" means TV Modulator. An STE should really be called an STFME ("STFM
Enhanced")

So your STF means "ST with a Floppy drive builtin"

(I've been an ST user and programmer since 1988, having gone from a
[1988] 1040 STFM to a [1990] Mega 4 "pizza box" to a [1992] TT)

Hi,

how can my program (In2Cat) test if Sting/Stik is online or not. I don't wont to call the dialer, because in case I need this option, it is because the user did not set the option for automatic login. Since by now I did'nt managed to make STING work under MagicPC with ISDN, I can't just play around with different ideas. One Idea was to try a resolve, but it seems, that the answers are cached, so the next time I get a result even if Sting is offline. Someone said: ping the POP-Server. Is this better?

Hi Derryck,

>Just wondering if anyone's tried one, would bring a wide range of devices
>within our range.

Last year I bought a Yamaha 2200S CD-Writer, this device comes with a factory installed removable IDE to SCSI adaptor. I've put an IDE cable splitter on the adaptor attached to a 40GB IDE hard disk. HD Driver recognises it and under MagiC 6.2 using FAT32 partitions it works perfectly...
The SCSI model costs $40 extra, IMO that's a bargain for an IDE to SCSI adaptor, I have no idea what the average data access rate of this adaptor is, but since the newest Yamaha writer can burn at 44X it should be capable of at least 6500Kb/sec, which is more then enough for the standard Atari computers. Unfortunately the adaptor can't be bought seperately, anyone who's thinking of bying a new writer...

Both the Yamaha 2200S and new released CRW-F1 (44X) models are recognised by CD Recorder Pro and CD Lab, the current package from Anodyne however doesn't work with these models (yet).

Cheers from Belgium
Dennis

What does "online" mean? Online with just another computer or some sort
of general "Internet connection"?

In short - STinG simply can't know if it's really "online"!

You might do it in another way:

First check which port is the default gateway, then check if this port is
activated in STinG.

If the default gateway port is active then STinG will be "online". And
this will work both on a dialup connection (the dialer activates the
port) and a permanent connection with the port activated on startup.

All I remember is that when that one came out a lot of Atari users got them (not me) and I kept seeing posts about how it wasn't working. Something about the drives firmware or something. Anyway, I noticed that they got sold off and other HD's gotten to replace them. My TT has an old 2gi HD in it, I think it's a seagate. Heck I've still got an realy old ST-225 SCSI HD sitting around! I think it could be hit with a nuke and still work.

I have it set up 2 ways for 2 STs:

On the first ST, I boot STinG.prg via an icon onscreen whenever I want
to go online via PPP. This means that after STinG loads, I have to go to
my Control Panels, under STinG internals and check off the ACTIVE box and
Modem 2 (the port I'm using) and save the change. I can then use the
dialer. I have to do this ech time I reboot if I want to use STinG.

On the other ST, I have STinG AUTOloaded so that it's in the AUTO folder
and is ready to go right off the bat. I also have the ACTIVE box checked,
the Modem 2 selection made and saved so that those steps are removed. I
can go directly to the dialer after boot.

Is that what you wanted to know?

>Is that what you wanted to know?

No. I'am adapting an Email-Programm to STING. In the setup the User can choose if the programm should automaticly call the Dialer and connect to the internet or not. If he shooses not to connect automaticly, the programm needs to tell the user to connect manually. But of couse I don't wan't to tell the user 'please go online' if he already is. So what I want is somthing like that:

```
if(connect_automaticly)
call_dialer
else
{
while(Sting_is_offline())
message("please go online");
}
```

what I still need is the function Sting_is_offline or Sting_is_online

Dimitri

2890. New mouse for STe ?!

Newsgroup: comp.sys.atari.st
Date: 2002-10-16 11:39:11 UTC
From: Pieter Verheyden <pverheyd@vub.ac.be>
Message-ID: <aojj31hth1@snic.vub.ac.be>
Source record: 31548

Hi all,

Just bought a STe, one problem: the original Atari mouse is a bitch. Can I just buy a new (modern) serial mouse to connect it to the STe? Are there certain brands which do not (or only) work with the STe?

Tnx in advance.

Hi,

You would need to verify this with the current sting maintainer,
but as far as I know sting will not report a dropped connection.
I was told since sting is multiport this not possible in that
scheme. If I'm on irc and the modem cuts outs my client is more
or less stuck, since it does not toss the client the dropped carrier
error code. The carrierdetect() call in sting is a dummy function
and always returns connected stated.

Best option would be to implement some sort of ping/timeout to get
around this.

Hello Pieter,

The Mabn in Rotterdam has adapted Amiga mice for use on Atari's. I recently bought one and they are very responsive and comfortable.

You could also try to find a Beetle mouse. I bought two of these mice and I love them. They originally retailed for a lot of money but are pretty cheap now. At any rate, if you don't mind using up the modem port, any serial port MS or logitech mouse can work on your atari using the mouse driver on several atari ftps, (http://portal.atari-source.com/storage/atari/), just search for either sermouse.lzh or genmouse.lzh, I forget what the name is.

2895. new discussion group for classic emulators

Newsgroup: comp.sys.atari.st
Date: 2002-10-16 21:32:21 UTC
From: rtdos@rocketmail.com
Message-ID: <a9758358.0210161332.293da7f8@posting.google.com>
Source record: 31555

I've created a general discussion group for classic emulators. The two reasons I am doing this is, one, to go along with my other group rtdos (http://geocities.com/rtdos & http://groups.yahoo.com/group/rtdos) and, two, not everyone has access to usenet (and if they do, they don't have access to usenet binaries). If you are a developer of an emulator or interested in non specific general emulators, then this group is for you. General emulators, such as M.A.M.E. & M.E.S.S. will be discussed as well as specific emulators for the Atari, Commodore, Apple, ti, Tandy, Timex, MSX, CPM, and other systems.

The Atari mouse isn't a standard serial mouse; in fact, there are
several protocols for serial mice for x86 systems, and AFAIK, the Atari
mouse doesn't use any of those protocols. That said, I recall hearing of
an adapter or driver for at least some x86 serial mice, but I don't have
a URL or recall the name. Try doing a Web search on appropriate keywords
and/or check some Atari file archive sites.

Surely the Falcon SCSI bus only needs termpower if you use an
active terminator (on the ST you also need it for the Link or
other host adaptor on the ACSI port, but that doesn't apply here).

If you refer to obtainable, I'd say the Hades060, but since
I have one I'm bias. ;-)
The Milan is a fine machine though, the 040 version can be upgraded
to an 060. I won't bother to speak of unreleased things, only time
will tell.

Sam,
That is the question of the DECADE!!! I am sure
that MILAN is still making computers. I recently
heard from a friend of mind that a shop by the name of
MABN is taking over making MILAN 060's!! One could
say that the Falcon with the CT60 maybe the fastest
Atari which is what I hope to have as soon as R. Czuba
is completed with the CT60. But then agian the XTOS
computer could also be in contention for the same
title as most powerful Atari compatible computer on
the planet. Hope this answers some of your questions
if not visit my Atari WEB site FAQ that I will post
here very soon. There are many helpful links to what
is new in the Atari scene!!! Including a very
powerful 32 meg GC for the CT60 that will be available
shortly after the release of the CT60.

Thanks,
Carey Christenson

Everyone,
Here is a ***NEWLY*** updated list of everything
that I have and some of what people have given me in
my e-mail. Thanks to all who have sent me there
favorite web-sites!!! This is meant as a good
resource for people to find web-sites related to Atari
computers. This list is by NO means complete and can
always be added to or deleted from if found that a
site is no longer operational. Please direct all
comments to me at firest@williams-net.com. Please if
you have any web-sites to add to this list by all
means send them to me and I will add them in. If you
find a web-site that NO longer works let me know and I
will check it out. I will do my best to update this
list at least twice a month and post in this
newsgroup. If this becomes to big I will break it
down into smaller messages and post each message one a
day as to not overload the newsgroup!! We as Atarians
must band together to help to ensure the survival of
our platform!!

Thanks,
Carey Christenson

>the dialer or not.

But remember that the Dialer is just one way of getting "online"! It's
just as likely that any of the other ports (Ethernet or serial) is the
default gateway to the outside world.

So by checking if the default gateway port is active it would work on the
computer I'm witing this on for example.

What makes it a bit more complicated is the fact that the Dialer istelf
can be setup to manipulate the routing table. With two computers on a
serial port LAN you only need to have the actual LAN port (modem1, modem2
etc...) in the routing table. When the Dialer is started it adds its own
serial port as default route.

So, there is no way to know in advance which port the Dialer will use.
Note that the Dialer is just another GEM program that talks to STinG via
the STinG API.

>>First check which port is the default gateway, then check if this port
>>is activated in STinG.
>
>
>How?

It's all in the STinG API. Check out the STING.HYP under "Programming
with STinG" in the "Port Manager" and "Routing Manager" sections.

But, because the Dialer normally makes alterations to the routing table
this solution will not always work.

I guess the best method would be to ask the user if he uses the Dialer or
a permanent connection in the program config dialog or whatever.

Then try to talk to the Dialer using the UDP "remote start" functions of
the Dialer program. If not found launch the Dialer.

Check if the Dialer has already dialed out. I seem to remember there are
some problems here. I did write a STinG remote dialer for Windows a
couple of years ago but can't remember. Olivier Booklage
http://obooklage.free.fr/ has written a remote dialer for TOS. There
might be some info in his package on the subject...

Milan is not making computers anymore.

> I recently
> heard from a friend of mind that a shop by the name of
> MABN is taking over making MILAN 060's!!

They are not identical to the Milan 040 or the planned 060. Instead
they are optimized for industrial purposes and not suitable as a TOS
clone.

>But then agian the XTOS
> computer could also be in contention for the same
> title as most powerful Atari compatible computer on

There is no xTOS computer. xTOS is an entirely different thing and has
nothing to do with hardware (anymore).

>got quite a large box of floppies too - mostly DD floppies from my STE
>collection, although there are quite a few HD disks as well (early
>Falcon stuff). I'm planning to make use of Anodyne's CDISO too.

You will not be sorry. It is a great program. The does require a blank
partition to write the file conversion before it starts to write to the CD.

>And after I finish that, I'm going to use a program called EPS Wizard
>(that runs on STs and the Falcon), which allows one to read and write,
>as well as backup to hard disk, DD floppies that are used with the
>Ensoniq EPS sampler (keyboard), since I have almost as many floppies
>for my EPS as I do for the STE!

I would just get CDBackup from Anodyne and backup those floppies/hard disk to
a CD. These CD's can only be read on an Atari CD-RW CD-drive. I put a CDBackup
CD that I had made into my STe and it did not come up. The CD drive in the STe
just has a read-only CD drive.

>My only question: Can anyone suggest a way to get the motivation
>needed to take on this project!?!?

The best way is to think about it and start. Once you start, the rest is easy.
I have some CD projects sitting right in front of me and typing this message
is putting me in the right frame of mind.

Hello All,

Just wanted to tell everyone that my article on Okami is up at the MyAtari site. Okami is the best newsreader for the Atari line of computers, but it is very hard to setup. I wrote this article in the hopes it would make it easier for everyone to use it. Once things are setup, Okami is very easy to use. Enjoy....

>Tnx in advance.

You can use a PC serial mouse, but you need a serial mouse adapter from Mario Becroft. I use the adapter on my Atari clone, which has the same mouse interface as your STe, and I use a Logitech mouse. Works great. There is also a piece of software that allows you to do this, but I believe you need to connect the mouse to the modem port of the computer.

I don't know what was the ultimate Atari ST, perhaps MegaSTE, or it was ultimate
STE ? ;) Well, now seriously. The ultimate TOS machine is definitely
Aranym (http://aranym.atari.org).

machine = emulator
If just running some app on a machine turns it into an ST,
well it's an emulator.

Sorry, Aranym is not the ultimate TOS machine as you claims it's
just an (good) emulator.
Please don't get me wrong. I do appreciate what the Aramyn team is
doing. In the near future I'll buy me a pc and there is no doubt about
it that I'll install Aramyn. I just want to put some thing in the right
context.

Message-ID: <WS3.86c62362.a4684662.chongdochongdo@ichongdo.com>
Source record: 31569

Hello everyone,

I could get a bunch of SMC 83C790 based ethernet cards, as well as
3COM 3C509 ones. Unfortunately, they are not compatible with the
EtherNEC, unless someone should write the appropriate drivers...
If so, they could be obtained for free (but the shipping - sorry,
I am not craesus) or, if not, will be trashed.
There are 10 SMC and 10 3COM ones : that could make 20 happy ST's
owners :-)

```

```
No. A platform is a machine + OS. So the better would be to say: The
ultimate TOS machine is a PC with Aranym.
```

```
> If just running some app on a machine turns it into an ST,
> well it's an emulator.
```

Aranym doesn't turn any machine into an ST (or Falcon, or whatever), it simply turns your PC into a best TOS machine ever made.

By that reasoning, Milans, Hades etc are just emulators. And not that good
of ones either
since running an old ST game from what I've heard is a pain.

If you want to argue, if it doesn't have the Atari branded Fuji on it, then
it's not an Atari. I can see that arguement. But once you start talking
about hardware that Atari didn't make, then I think any hardware that can be
made to specifically and solely run Atari software would qualify
as a clone. That's the stated goal of Aranym. A goal from my impression
that they are quickly approaching. And since they aren't making full 060's
anymore, the question of a clone that doesn't have to emulate some part of
the system if pretty much gone.

The short answer has already be sent. You can't with STing. Peter felt
very strongly that having
a routine knowing whether your machine was connected to a network was
inappropriate. He didn't care that most major OS's seem to be able to
handle this fact. He also ignored STiK
compatibility when he did the implementation and returned 1 instead
f -1. -1 states I don't know, where 1 states I am. Maybe he changed it
later, but he and I had big fights about this one
years ago.

About the only thing you can do is attempt to connect to some hard coded IP
address with STiNG and see if it works.

I don't think _any_ OS / ip stack with multiport and routing capability
can determine its online status. If I unplug the main tp cable from my
NAT box my Windows computer still has its 192.168 ip addres from my local
DHCP server and very much thinks it's online...

If the default route is active with an ip addres the computer is online.
This is how my Windows computer works and CAB with STinG shows the same
behaviour.

If I deactivate the default route port and opens a html page in CAB it
loads fast ignoring online links. Typically spam html mail I like to
check without the posters knowledge.

With the port active and this computer _online_ on my LAN but without
further connection to the outside world (main tp cable not connected to
my NAT box) CAB has to timeout for each picture and takes forever to load.

So, Peter was perfectly correct when he did not try to implement any
"online status detection", simply because it can't be done.

The final answer to the question "is my pop3 client online?" is simply to
check if there is a connection to the server by using Ping.

Martin,

Though I haven't been following the highwire list, the online functionality simply isn't done quite properly yet last time I checked. Probably someone accidentally left the initial online functionality turned on in the build. Oops ;-) I could be wrong and it could be completed though I am not sure. I think that there's an internal prioritization system for image rendering and downloading that needs to be finished. As with anything related to highwire, the developers do not want to release anything that isn't good ;-)

I doubt if they would work even if you wrote a driver. The problem with the
EtherNEC is that it does not conform to AT/ISA bus timing, and only the
Realtek cards are quick enough to work. In theory other NE2000 clones may
work but I have never found one that does. Some will read the MAC address
but most don't even get that far...

Mathias,
Milan may or may not still be making computers.
But, I raise the question to you if they are not
making computers how could they still be in
business??? I heard from a friend of mine in HOLLAND
where the MABN is located at, that they will be making
MABN MILAN 060's for anyone who wants one. They are
totally suitable for the TOS platform. They are
basically the MILAN 060. What kind of INDUSTRIAL
purpose could MABN be making these for??? These are
made for the average person into the Atari platform.
Matter of fact he was in contact with someone from the
MABN and they said that they were working on obtaining
the rights to put TOS on this MABN MILAN 060 from
MILAN themselves. As far as the XTOS that is total
BS. ACP or XTOS what ever you want to call it is
totally about hardware. Besides that I just heard
earlier this week that FREDI Aschwanden is BACK. So
it will hopefully become a reality in the next year or
so.

Thanks,

Carey Christenson

Hi, I'm Ben Smith of Bravo Sierra Computers! Your Benefactor, an Atari Dealer. Offering Sales, Support & Service of Atari HardWare, SoftWare, Books & Accessories for the Classic Atari 8 Bit and Atari ST Computers plus the 64 Bit Atari Jaguar Game System. I am a Reseller of Used & New Atari Collections! Much of which were the Treasures of Former Atarians, Locked away in Dungeons, now given New Lives, offered to be sold as New found Treasure, back in Circulation in the Atari MarketPlace. Hidden and Forgotten, Now set free from the secret hiding places. Atari Heaven where former Atarians had left them to Die. Saving Wondrous Collections from being irretrievably Lost! As well as Saving entire inventories from defunct Atari Dealers, much of it +NEW in the BOX/BAG! After Languishing in Forgotten Warehouses, long abandoned by retired Atari Dealers!

I love saving my customers money! I mainly use Postal Delivery! I save money for my customers when using Postal 2-3 Day Priority Mail & Global Priority Mail. I use Packaging supplied by the Post Office for free and Pass on the savings. I sell Atari, I'm not in the Business of Profiting from Marking up on the cost of Shipping! And just like the Postal Service I avoid making promises I cant keep. The Post Office sends Packages by 2-3 Day Priority Mail. They don't promise 2-3 Days but they have a Good record of Following through! Once I receive payment, your order usually goes out the same Day! This is not a Promise, but like the Post Office I have a Good record of following through! Ask my Customers! I also have Libraries of Reference Books for the Classic Atari 8 Bit and the Atari ST Computers! I have ways of saving Money on Postage by Sending it Book Rate. I also have some tricks for saving on Postage when Mailing outside the United States! I Ship Atari anywhere the Law allows! If you dont come to me, I cant save you any Money!So check my HotLinks below, E-Mail me at atari@aracnet.com or call Ben anytime at (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

Got Atari Questions? E-Mail or Call Ben 24Hrs, anytime at (503)256-9974!

Machine + Native OS! Machines that emulate a CPU, is noting but an
emulator. Whatsmore, machines that needs an OS to run a second OS, is not
a TOS clone, but a OS machine. That is, if the emulator needs Windows to
run, the machine is a Windows PC. If the machine needs Linux, or Mac OS X
to run the emulator, none of these are TOS Clones!

Oh god. I'm gonna say this only once; A TOS Clone is hardware BUILT TO
RUN TOS!!!

Hardware Atari didn't built. Okie, another definition; The only
difference between Atari-built TOS machines and other-firms-built TOS
machines is the company names. The important thing is the intention,
HARDWARE BUILT FOR/TO RUN TOS!!

Clear now?

I downloaded a PD/Shareware game called "Fantastic World" which is a Zelda type game and I tried it on my STE. Only it will give me two address errors at the same time (no bombs) when i try to run it. I think the STE had 1.62 built into rom. Seems I tried everything including making an AUTO folder but nothing seems to work.

I tried it on an emulator with TOS 1.00 and it worked fine. Anything patches/fixes I need for a newbie ST user t get this game working?

A TOS clone is a clone of TOS. For example EmuTOS. ;-)

Like the original 68k Atari computers, the Milan/Hades are TOS machines,
as in machines that can run TOS (not quite the same as for the real
Atari machines, but it provides most of the same functionality).
I'm not sure I'd call them Atari clones, since they don't have a whole
lot in common with the Atari machines besides the type of CPU and the
ability to run TOS programs.

ARAnyM is a virtual machine that can run TOS.

>machines is the company names. The important thing is the intention,
>HARDWARE BUILT FOR/TO RUN TOS!!

By that definition there are no Linux machines, since no hardware I
know of has been built for the specific purpose of running Linux.

A more reasonable definition of a '<whatever> machine' is a machine
running <whatever>.
How it runs <whatever> is really only of academic (and religious,
I guess) interest.

> Clear now?

I guess not. ;-)

> ACP or XTOS what ever you want to call it is
> totally about hardware. Besides that I just heard
> earlier this week that FREDI Aschwanden is BACK. So
> it will hopefully become a reality in the next year or
> so.

No, you are talking BS. At least I have been to the two developer
meetings so you are probably not as informed as I am :-)
You wrote that xtos is about hardware. That is not true, just look at
xtos.de. ACP is of course about hardware but *now* (well, actually
over a year) totally unrelated to xtos. None of the people involved in
the ACP are part of xtos.

Matthias

> Milan may or may not still be making computers.
> But, I raise the question to you if they are not
> making computers how could they still be in
> business???

Milan (the company) only provides very little support for the existing
user base. That doesn't mean that the ones who developed the hardware
stopped making hardware. There has not been any great updates to the
milan website since about two years.
They also own the rights to develop and distribute modified versions
of TOS. But thats's not really business anymore.

> What kind of INDUSTRIAL
> purpose could MABN be making these for??? These are
> made for the average person into the Atari platform.

Well, my info is from Milan and they say that the mabn milans are
optimized for industrial purposes. look at the readme file of the last
tos update and you'll see that new os calls have been added to take
advantage of the new components (more serial ports etc.).

Hi!

MNB> Sorry, Aranym is not the ultimate TOS machine as you claims it's
MNB> just an (good) emulator.

Full ACK!

MNB> Please don't get me wrong. I do appreciate what the Aramyn team
MNB> is doing.

ACK again!

MNB> I just want to put some thing in the right context.

Right.

It has become some kind of religious question wether you consider ARAnyM a clone or an emulator. The ARAnyM team calls it clone. I don't see it that way.

To me a CLONE of a certain kind of machine is a HARDWARE dedicated to run the same system as the original machine.

See Apple computers: There have been Apple-CLONES (UMAX machines are the only I know about) and those machines were built to run MacOS plus applications.

Medusa, Hades, Milan, Eagle - these machines belong tho the category Atari-CLONEs.

An EMULATOR is a SOFTWARE dedicated to run the same system as the orininal machine on top of a different system with different hardware, not dedicated to the emulated system.

ARAnyM belongs to this last category. It is an Atari-EMULATOR, on the way to become the best one ever. It is developed with the goal to make a standard-PC boot up directly into an Atari-System. Thus it is even more than an EMULATOR.

Call it VIRTUAL MACHINE or VIRTUAL ATARI (as it has been done already) to point this out and I guess that almost everybody will agree. But accept that the pure "software" way as you take it cannot be accepted as a HARDWARE-CLONE.

Regards,

Alexander

> Oh god. I'm gonna say this only once; A TOS Clone is hardware BUILT TO
> RUN TOS!!!

Wrong. There are two steps in process of making a new TOS machine (original Atari or clone):

1. Designing of a new hardware. From the hardware point of view, that new machine can be very similar to previous model (as STE vs ST), but also completely different (Milan vs Falcon).

2. Rewrite TOS for the new machine. The Falcon needs different TOS than ST, ST needs different TOS than TT, Milan needs different TOS than Hades, etc..
It is a TOS, what making a TOS machine, not a hardware. Even on a real AtariST/TT/Falcon you can replace your Atari videochip by an ISA/PCI card, your atari mouse and keyboard by an PC mouse/keyboard, your Atari monitor by a SVGA and so on (floppy HDD and standard ports were allways the "PC ones"). This is called upgrade.
Ask anyone how should look the perfect TOS clone. People wants AGP, PCI, USB, FireWire, ATA disks, ps/2 for moder optical mouses with wheel etc, etc.
In fact, everyboy want a PC hardware with TOS OS and applications. That's exactly what Aranym is.

Aranym philosophy is:

1. take a widely available hardware
2. rewrite TOS (EmuTOS/Mint..) for it

> Hardware Atari didn't built. Okie, another definition; The only
> difference between Atari-built TOS machines and other-firms-built TOS
> machines is the company names.

No, it isn't ! The hardware is completely different, the TOS is different.
They must be different, otherwise it would be only a exact copy of a original Atari machine, not a new TOS clone.

> The important thing is the intention,
> HARDWARE BUILT FOR/TO RUN TOS!!

Actually the PC hardware was never built for Linux, xBSD, Solaris, Qnx, BeOS, Hurd... Do you really mean these OSes are not real ?

Then any PPC MAC is just an emulator, any accelerator card with PPC or
Coldfire is just an emulator, any PPC/Colfire TOS clone is emulator as well.

> Whatsmore, machines that needs an OS to run a second OS, is not
> a TOS clone, but a OS machine. That is, if the emulator needs Windows to
> run, the machine is a Windows PC.

Yes, the Aranym needs underlying linux *core* to run. This core is used only as a set of drivers between PC hardware and Aranym itself. If you don't like it, then sit down and write drivers for most existing PC hardware (motherboard/chipset, video, sound, mouse, network..) directly into Aranym or simply link all needed HOST OS stuff into Aranym binary. All is possible when someone write it. However, there wouldn't be any difference in functionality, except psychological aspect.

You need enough space to write the ISO file to, the partition doesn't need
to be empty.

Cheers

Derryck

Looks like one can twist and turn things to the extreme ;-) An Atari/TOS clone is a combo of hardware and software built for the one purpose of being new hardware running TOS.

>
> Like the original 68k Atari computers, the Milan/Hades are TOS machines,

You do realise that by that definition, you wont call the Falcon a clone (if it wasn't Atari's own), because hardware wise its very far away from the ST? I'm not saying the hardware have to be similar across different Atari/TOS clones, I'm saying that the hardware must have been made for the sole purpose of running/being an Atari/TOS replacement.

>
> ARAnyM is a virtual machine that can run TOS.

Yes, you are right. You cant go into the store and buy a Linux machine.
But you can infact get Linux machines. I might be on thin ice here, but I
have heard (only heard, dont know) that there are machines built to run
Linux. We're not talking i386 machines here. Most PCs ppl buy in shops
these days are MSDOS/Windows machines. They were made to run Windows!

>
> A more reasonable definition of a '<whatever> machine' is a machine

No, there is a big difference between a machine running Windows, calling
it a Windows PC, and a machine running Windows, emulating TOS. That
machine is still a Windows PC! This has nothing to do with religion, it is
plain facts.

>

Where did I say that Hardware had to NOT be different? That is not the
issue. The issue is the intention the maker of the hardware have, not how

advanced, or different from other Atari/TOS machines/clones the hardware is. You are right, new hardware needs support from TOS. This is the very essense in what I'm trying to get across, TOS is modified to run NATIVELY on the new hardware that is MEANT to run TOS.

As I stated in another posting, most PC's you buy in normal computer shops these days are Windows PC's. Even if it run Linux, its still PC built with Windows in mind. You see, even if a TT or Hades or Milan or Falcon can run Linux and FreeBSD (or any other OS), they're still Atari TOS and Atari/TOS Clones!

>clone is a combo of hardware and software built for the one purpose of
>being new hardware running TOS.

That would not be my definition, but then again I hesitate to call
any of the TOS compatible machines clones.

Note, however, that I've never called ARAnyM an Atari clone (or TOS
clone for that matter). Nor has any other ARAnyM developer, as far
as I know.
If you look at the top ARAnyM web page it says:
"We would like you to think about ARAnyM as about yet another TOS clone..."
That is very different from claiming that it is one.

It's pretty obvious that ARAnyM itself is not an Atari clone, since
it is a software program. A PC running ARAnyM also does not stop
being an IBM PC clone. It does, however, according to my definition,
become a TOS machine, just as it would become a Linux machine if
I booted up Linux on it. For that matter, it can be a TOS and a Linux
(and Windows for example using VmWare) machine at the same time.

>> I'm not sure I'd call them Atari clones, since they don't have a whole
>> lot in common with the Atari machines besides the type of CPU and the
>> ability to run TOS programs.
>
> You do realise that by that definition, you wont call the Falcon a clone
>(if it wasn't Atari's own), because hardware wise its very far away from

Of course. The Falcon most definitely is not an ST clone, and since it
is a machine done by Atari, it is by definition not an Atari clone.
It, like the TT, is, however, a TOS machine, and one that was designed
to be relatively compatible with the ST on the hardware level.

>the ST? I'm not saying the hardware have to be similar across different
>Atari/TOS clones, I'm saying that the hardware must have been made for the
>sole purpose of running/being an Atari/TOS replacement.

Hardware is made for the purpose of running software. It doesn't care
what software. Even if the company that built it had some specific idea
about what software to run, why should I care?

>> >machines is the company names. The important thing is the intention,
>> >HARDWARE BUILT FOR/TO RUN TOS!!
>>
>> By that definition there are no Linux machines, since no hardware I
>> know of has been built for the specific purpose of running Linux.
>
> Yes, you are right. You cant go into the store and buy a Linux machine.

According to your definition.
According to my definition, a Linux machine is a machine that runs
Linux, and I can certainly do that on a PC bought in a store.

Of course, with that definition the machine is not a Linux or Windows
machine when it is turned off. Then it is just a heavy paperweight.
But the intended function of the machine may be to be a Linux, Windows,
TOS, games, Photoshop, web server, DVD player, etc machine, or any
combination thereof.

>Linux. We're not talking i386 machines here. Most PCs ppl buy in shops
>these days are MSDOS/Windows machines. They were made to run Windows!

They were made to be IBM PC clones.
That means they can run a very large number of OSes and software
written for such hardware.

>> A more reasonable definition of a '<whatever> machine' is a machine
>> running <whatever>.
>> _How_ it runs <whatever> is really only of academic (and religious,
>> I guess) interest.
>
> No, there is a big difference between a machine running Windows, calling
>it a Windows PC, and a machine running Windows, emulating TOS. That
>machine is still a Windows PC! This has nothing to do with religion, it is
>plain facts.

According to my definition, the machine would then be a TOS machine
as well.
Not a TOS or Atari clone, but I've never said that.

The current Milan 060 that is in production (not by MABN) is a custom design
with RS485-capable serial ports, and some additional custom hardware. TOS
does run on these, but the machines are not sold separately.

AFAIK, MABN is thinking about a new production run of either the "old" Milan
060 board (rev. 2.0) or some modification of that design.

>

Well first I think it's important to note that Microsofts implementation of
TCP/IP,
while a major portion of the user trafic on the net, should not be
considered the
ultimate implemenation of the protocols.

However when you configured your Windows boxes internet connection, you
should have been asked how you would connect to the internet. I think there
are 3
options, I only remember 2 right now and that's good enough for this
argument.
1. Connect through a modem and 2. Connect through a LAN. (ie ethernet).
If you setup connect through a modem, Windows does indeed know it's online
status,
and can be configured to automatically connect or prompt you when you
attempt to
go online. My Mac also seems to have this wonderous ability to know that if
it is connecting
to the internet it needs an active route.

> If the default route is active with an ip addres the computer is online.
> This is how my Windows computer works and CAB with STinG shows the same
> behaviour.
>

Through a LAN this is correct. It will function this way. However it's a
failure of the setup
that your router is not returning the proper error codes on the network,
when the packet
gets to the gateway and the gateway see's that the interface is down (ie the
hardware should
be reporting the problem of no link from the missing cable).

> If I deactivate the default route port and opens a html page in CAB it
> loads fast ignoring online links. Typically spam html mail I like to
> check without the posters knowledge.
>
> With the port active and this computer _online_ on my LAN but without
> further connection to the outside world (main tp cable not connected to
> my NAT box) CAB has to timeout for each picture and takes forever to load.
>

Again the system should be able to be configured to alert you when it is
inactive.
We are discussing at this point small routers for a house or small business,
most of
which will only have 1 route to the internet. If that route is down, it
doesn't matter
to have the packets bouncing around your LAN looking for an alternate path.

> So, Peter was perfectly correct when he did not try to implement any
> "online status detection", simply because it can't be done.
>

Again I don't agree with you at all. As I said I fought with Peter about
this quite a bit. Martin, David
and I were working on STiK2 and trying to keep compatibility with STiNG's
API. In the end it broke
down for several years before Ronald took over maintance. (Who by the way I
will say is a really nice guy).

Here are a few arguments about the problem.

1. If the routine (carrier_detect) was a dummy routine it should return 0
for unknown and not report that it
is online. The reasoning for this design was that some modems would not
tell if they were online
and there needed to be a back up method to let an application know that it
may not be online.
This allows a programmer to avoid extra testing when not necessary and also
allows the application
to give a more accurate report of the situation when a problem occurs.

2. It completely ignores a major part of the user base. While there are a number of people that
ran/run serial/midi LAN's with multiple ataris, the average person was still concerned about getting
one machine up onto the internet to get their mail etc. These users with 1 machine and 1 modem can
tell their online status as easily as a windows or mac user with 1 machine and 1 modem. It's no great trick,
the source code for the Atari exists and was easily available.

3. The problematic implementation and handling of network errors was a real pain in the A$$ to work with
under STiNG. If an interface has a physical problem, like no conection to it. It should be alerting the system
with appropriate error codes going to applicable clients. It shouldn't just sit there happily eating the packets
without any notification. While the client sits there happily thinking 'I'm online and the network is fine'.

> The final answer to the question "is my pop3 client online?" is simply to
> check if there is a connection to the server by using Ping.

I think this is the biggest argument showing the fallacy of stating that it can't be done. If people didn't see
their friends Windows or Mac prompting whether they should go online, it wouldn't be a question at all.
If you are connecting through a LAN, then it can be hard to tell if you are connected to an outside source,
but in reality that is all carrier_detect was really doing. You can look at the code in STiK if you want.
The Carrier_detect() routine is just a fast way of saying we have an active link with the outside world.

The 3 values in laymans terms break down to this.

1. We have an active outside (of this machine) link with no problems reporting. (It is physically working with no
errors on the hardware).

0. Unknown. We were offline, but we were told to connect. We weren't told to disconnect, but I can't tell if the hardware is working or not.

-1 We have no active ouside (of this machine) links.

I could go on farther with this, but I think I've made this message too long already.

There is no way to connect IDE drives to the TT. Any SCSI drive will
work, however, because the TT has a standard 8 bit SCSI bus. JAZ drives
are used by quite a lot of TT owners, there are no known issues with them.

Hi there.

We have put our classic ATARI boxed games on ebay all with NO RESERVE!

Just search on "CLASSIC ATARI ST" and there they are!

Thanks!

Donald and Cheryl

Hi All

NEW ON TAMW:

The CODEHEAD MIDI Software is now released:

http://tamw.atari-users.net/codehead.htm

This includes GenPatch, MidiSpy and MIDI Max.

Thanks for all those involved with the release!

ALSO: General Midi (GM) compatible instrument definition
file for the Atari Mozart's Dice program. Created by
Martin Tarenskeen.

http://tamw.atari-users.net/mozart.htm

ENJOY!

Date: 2002-10-20 16:15:08 UTC
From: Mark Earwood <mark.earwood@btinternet.com>
Message-ID: <aoukqckqm1@venus.btinternet.com>
Source record: 31521

Hi All I have a German copy of (Notator)Logic Audio Falcon. The
software is English, but the docs are in German.
Does any German speaking owner have an English manual and ver
2.0 supplement that they would be willing to swap with me?
Alternatively, does anyone know where I might be able to
obtain the english manuals?

Mark.

2965. How to recover data from a defective HD ?

Newsgroup: comp.sys.atari.st
Date: 2002-10-20 21:53:00 UTC
From: blutrunst@yahoo.de
Message-ID: <7d24ed2c.0210201353.731ffa8a@posting.google.com>
Source record: 31524

My hard disk , that means at least one partition of my 10-year old 48MB Seagate drive is defective.While copying , there was a read write error , computer crashed and the FAT of this partition has been destroyed.

Undelete utilities woni¿½t work , I think sectors of the FAT are bad.

Most of the data was plain ASCII text , so it must be somewhere on the HD , even if some of the sectors are defective it must be possible to recover some of the data.

What I need now is some kind of disk monitor.I have several ones , that only support floppy disks and with this ones it was always possible to recover data from a floppy disk.

But they doni¿½t work with hard disks.

Or a program which allows me to save certain sectors to one file.

There were about 200 ASCII files , each maybe 1Kb , not much , maybe 200Kb of a 12Mb Partition.

2966. Site crashing Cab v2.7c

Newsgroup: comp.sys.atari.st
Date: 2002-10-20 22:58:55 UTC
From: jfhaslam@zetnet.co.uk
Message-ID: <3db3352d$0$253$4c56ba96@master.news.zetnet.net>
Source record: 31525

Hi all!

I'm having a problem getting into a particular site, using Cab 2.7c with Dan Ackerman's OVL v1.4401 (via StinG v1.26). I keep getting a Basic Error report which then crashes Cab completely. I have MagiC v6.01 on my Falcon, it only affects Cab and MagiC keeps on going. I have tried shutting down and restarting to no avail.

The site is one I have used many times fine with Cab. It is the Dreambook Management login page (Dreambook is a Guestbook site, which I use with my website).

Can someone have a look with their setup, especially if you use a similar setup to mine?

This is the URL I'm trying:
http://manage.dreambook.com/index.cgi?Nscmd=Nlogout

Cheers for now!

James

KnifeST should be able to do that. If the files are only 1kB, they won't e fragmented. Knife has a 'build' feature - preferably on a floppy in your case. Don't know where you can get it - it was commercial rom HiSoft but has featured on a cover disk. It's no good with large partitions, but should be OK with your 48 Meg one. But it can take quite some time, as you have to decide whether the next cluster belongs to what you already have when the files are over a cluster long.

Regards, /Peter/

> Dan
> aka baldrick

I did not mention arguing nor fuji's.
I simply stated a FACT. Nothing more.
Some people have real problems with facts.
Aranym is no different than stonx, gemulator or steem, they all
have some uderlying OS that is not Atari at all.
You do not have a Hades, do you assume it has some underlying
```

foreign file system? It don't, it's 100% tosfs through and though.
So it is not an emulator. Games? The typical peecee user would use
a game to rate a system. :-P

Well one of the aranym team members tried to join my Atari Clone
mailing list. So at least one of them "thinks" it's a clone.
It's a closed mailing-list and the subscription was rejected.

2973. Stand alone Atari OS for PC (Was:What happened to the Milan?)

Newsgroup: comp.sys.atari.st
Date: 2002-10-21 07:56:04 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <007732f8@fmlynet.org>
Source record: 31545

FamilyNet Newsgate

Is Aranym a OS in itself? You see, I believe that if you truly wanted to claim TOS clone status you could simply have it as a PC running TOS as the PRIMARY operating system. In my eyes it would be an Atari OS machine at that point.

Just because the motherboard doesn't say Atari or the processor not a Motorola type doesn't mean it wouldn't be an Atari dedicated machine. If this were the case that would take out the C-Lab, Hades, Milan, etc (those with the Atari fuji on the mother board).

All and all, if we wanted to have a project, why not make a stand alone Atari OS for the Intel/AMD computers?

Saw an add for a cartridge that would break the source code of any ST program. I was thinking if so, this would be helpful in porting ST games to the Atari Jaguar.

But I dygress, can anyone tell me about this? Does anyone have one to sell?

Thanks,

Doctor Clu

Same problem here (Cab 2.8).
Looking with IE on the PC, I can see that the first tag is
missing on this page.

Bye,
/Pascal/

Correct. For large ISO files I use a 1 GIG Jaz cart. Or if you do not have the space, just copy your file tp a CD in sections and it will give you the same results.

Yes, I tried to access it also and Cab 2.8 crashed. However when I used the Cab.ovl file for MagicNet, Cab did not crash, but told me that the file cannot be found. This usually means the site has updated their HTML source code to a point where Cab cannot interpet it. Cab either needs to upgraded or else Dan needs to release another OVL file. Of course when Highwire comes out, it will probably load the above site with no problems.

> Hardware Atari didn't built. Okie, another definition; The only
> difference between Atari-built TOS machines and other-firms-built TOS
> machines is the company names. The important thing is the intention,
> HARDWARE BUILT FOR/TO RUN TOS!!
> Clear now?

About the only thing clear to me is the fact that we have a bunch of people here unwilling to open their minds or accept other possibilities.

To matter the fact, if I didn't know better, I would say that our users here are afraid to accept an AMD running TOS over a Hades. What's the difference? Neither have the Atari name stamped on them. The AMD would actually run a dedicated TOS/GEM OS (if one were to be made). The major difference is that one cost $500 (AMD) verses $2000? (Hades)

What's the matter gents? Afraid to share your toys?

Who is to say what a platform is built for. Granted, Atari made their machines and put an "Atari OS" on them. Oh wait.. I forgot, they took elements of DOS and some of the lineage of GEM.. so we don't exactly have a true original OS here.
Add to this that an Atari can run Linux (68030 class and higher), and have I heard Unix?

Well, AMD and Intel computers run GEM, DOS, Linux and Unix. Getting kinda gray here.

AMD... is it built for Linux or Windows? Or Unix? Or GEM? Who determines what a piece of hardware is used for? The user.

If I wanted to put Mac OS on it, sure I could. I could make it an Amiga, I could make it a TOS Box. It all depends on me.

Gentlemen, I'm getting tired of this exclusive way of thinking. It is either an Atari made computer, or some overpriced antiquaited piece of nearly homemade hardware, or it's not at all.

How about this?

Vintage= A computer made by Atari. Here it would be an 520 ST to a Falcon.
Special Market = Those companies that decided to build a computer specifically for the Atari market. Clab, Milan, Hades, ect.

TosBox - Any computer that makes running ST programs possible.

Now while an AMD can never be a vintage computer, to simply cast it off as "not good enough" because it was "made for something else" is a crock! You want an open market? You want to show how good the Atari OS is? Be more accepting of other possibilities.

Vintage Computer Festival 5.0
Saturday, October 26 - Sunday, October 27
Moffett Conference & Training Center
Moffett Federal Airfield
Mountain View, California
http://www.vintage.org/2002/main/

The Vintage Computer Festival is an international event that
celebrates the history of computing.

The mission of the Vintage Computer Festival is to promote the
preservation of "obsolete" computers by offering people a chance to
experience the technologies, people and stories that embody thexi
remarkable tale of the computer revolution.

Through our event and the Vintage Technology Cooperative Resource
Center--our publicly accessible archive of computer hardware, software
and literature--we promote interest in researching and documenting the
history of the computer. Above all, we promote the fun of playing
with old computers.

The Vintage Computer Festival is back with VCF 5.0 this weekend!
Enjoy talks on computer history and see dozens of old computers that
you've probably never seen before or never knew existed! Take the
Nerd Trivia Challenge. Show your stuff at the Retro-Code competition.
Take a tour of the Computer History Museum, or an excursion to the
DigiBarn.

Doors open at 9:30am. Talks begin at 10:00am and end at 2:00pm each
day. The Exhibit and Marketplace opens at 2:00pm and ends at 6:00pm
each day.

Admission is $10 per person per day for full access to Speakers, the
Exhibition and the Marketplace, or $4 per person per day for
Exhibition and Marketplace access only. Kids 17 and under are
admitted free of charge, and parking is free.

SPEAKERS

Year after year, the VCF produces an interesting and ecclectic line-
up of talks geared towards the computer history buff and the old
computer collector. The speaker schedule including abstracts and
speaker biographies can be found here:

http://www.vintage.org/2002/main/speakers.php

EXHIBIT

As always, the exhibit area will be full of dozens of old computers ranging from the late 1960s to the mid 1990s. See prototypes, first machines (i.e. serial #1), early GUIs, old iron, etc.

MARKETPLACE

The VCF Marketplace is the best place to buy, sell or trade those tired old computers yearning to be turned on again. It's the easiest way to unload that garage full of old computers. Sell them on consignment and let us do the work for you! Information on selling at the VCF Marketplace can be found here:

http://www.vintage.org/2002/main/vendor.php

TOURS & EXCURSIONS

We've got lots of tours lined up to the Computer History Museum, the DigiBarn, and the California Air & Space Center. Tour information including times can be found here:

http://www.vintage.org/2002/main/tours.php

CONTESTS

Think you know your computer history? Then take the Nerd Trivia Challenge!

http://www.vintage.org/2002/main/ntc.php

Think you can you write a full-blown video game in under 2 hours? Strut your stuff at the Retro-Code Programming Challenge!

http://www.vintage.org/2002/main/retrocode.php

DIRECTIONS

VCF 5.0 is being held at the Moffett Training & Conference Center (MTCC) at Moffett Federal Airfield in Mountain View, California.

Directions to Moffett Field and to the MTCC can be found here:

http://www.vintage.org/2002/main/directions.php

Be sure to bring along a valid picture ID (i.e. state driver's license or ID or a passport) to show to the security guards at the main gate.

LODGING

For out of town guests, hotel information can be found here:

http://www.vintage.org/2002/main/lodging.php

SPONSORS

VCF 5.0 is sponsored by the Computer History Museum and the Alameda County Computer Resource Center.

From: Steve Stupple <Steve@atari.org>
Message-ID: <dUadOxHt4Ft9Ew2c@atari.org.uk>
Source record: 31543

Hi all

Just curious as I've got the Falcon up and running and wanted a break from archiving floppies onto optical disks, is there any software for the falcon that can turn it into a audio processor for a guitar?

It would be nice to be able to plug the guitar and have the falcon process the audio in real time, then straight backout to an amp. I reckon it would kick some serious butt over dedicated (expensive) processing units:)

Which now has sprung a thought, wether i could do something via my Lynex sampler and guitar!!

>possible to recover data from a floppy disk.
Er... Mutil can do that : it can copy sectors from/to a partition.
Unfortunately, it won't work on a ST*e*, TT or Falcon, but will on
a ST or ST*f*.

>But they donï¿½t work with hard disks.

>Or a program which allows me to save certain sectors to one file.

>There were about 200 ASCII files , each maybe 1Kb , not much , maybe
>200Kb of a 12Mb Partition.
If data isn't fragmented, you'll be able to recover most of it.

Good luck,
J.-Luc

Hi Steve,
If I understand your question correctly, any audio can be sent to the
Falcon stereo audio inputs and be prcessed by Cubase, etc., direct to the
hard drive while the Falcon outputs are monitored. Programs including
Aniplay will play a number of different audio file extensions through the
Falcon audio outputs to any amp! No extra hardware needed!

As long as this hardware host needs another operating system to run
TOS/GEM apps, It can't be considered a TOSBOX as you wish to call it.

The day you can boot the PC straight into TOS, (alright, I'll take a PC
TSR to remap hardware if needed,). that'll be the day.

some autoexec (load some hardware interface for aranym)
load aranym.
Bam!, TOSBOX. (no problem here).
That would be great.

I understood that the original idea about Aranym was exactly that, am I
wrong? Or is Aranym just an advanced "Basilisk" tailored for TOS?

> mailing list. So at least one of them "thinks" it's a clone.
> It's a closed mailing-list and the subscription was rejected.

Unless one of the team members actually told you they thought Aranym is a clone, you're conclusion is invalid. The individual may actually also be interested in clones, or just wants to make sure Aranym will run on them.

Either way, the squabbling over what is and isn't a clone is really pointless. It gains no one anything.

One of the messages commented about original OS's or something like that. Well, don't forget that DOS has CP/M roots, and Apple stole the mouse/GUI idea from Xerox.

What difference does it make which processor it runs on. Af far as I care, if the OS and software runs "natively" on any processor without having to have a separate OS installed (or pieces of it) it's a clone solely because Atari Corp didn't physically make the hardware. And something like an Autoexec file doesn't count as an OS underpinning. After all, we have the Auto folder that does essentially the same things for us that the autoexec.bat file does for the MS DOS/Windows OS's. Remember FOLDERXXX.PRG to solve the 40 folder bug? And other programs run via the Auto folder that get run via autoexec.bat on MS machines?

If everyone would have put as much effort in trying to get someone to buy an Atari system as they have in this and other (essentially) meaningless discussions here, maybe the computer would have survived.

Just my 2 cents.

Ken

2994. New on TAMW: The Grid Sequencer !

Newsgroup: comp.sys.atari.st
Date: 2002-10-22 05:59:04 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0210212159.19b4ce60@posting.google.com>
Source record: 31454

NEW on TAMW: (Tims Atari MIDI World)

The GRID SEQUENCER

By Matucana
Released as Freeware October 2002
Based on a dream of Tim Conrardy

I had a dream..October 2002

I walked into a room of what appeared to be a pawn shop. Many mechanical and strange devises were strawn about on tables and shelves. I heard an interesting sound and looked up and saw to my eyes what looked like an "old" ARP 2600 synthisizer. It was a large rectagular box with many knobs and even small speakers on each side.It had a "gold" appearance and shimmered in the pawnshop lights.What was interesting about this "box" is that it had a large grid in the middle of it. The grid had many small pins inserted into it.Getting closer to the instrument, I pushed a button. Sounds started coming out of the speakers. Analog Bass Sounds. I tweaked the filter controls.Squeaks and squaks came out of the speakers.Then I took a pin from the grid and inserted it into another hole of the grid. The sound changed. The notes coming out were different. Then I realized that the grid was actually creating the notes. I could insert a pin in another location and that would change the notes coming out. I looked up and heard the sounds coming out of the speakers.I could almost feel the notes. Then ...I woke up!

Feeling inspired, I posted to the Atari-MIDI programmers forum and told them about the dream and felt that the grid concept might be a good idea for a different type of sequencer and narrated some possabilities. To my wonder, Matucana (also know as Hellmuth on the list) replied and actually created a program based on my dream! The result is The Grid Sequencer. Instead of pins, you use the mouse to "insert" the pins into the grid. Whats more, it is an interactive instrument with many possabilites then I could dream of (literally) You could say..this was a dream come true!

Check out my newly created page with screen shots, more info as well as the download! There is also a link to Matucana's Web Site where you can check out his other programs and his CD's.

Who said that? I sure didn't say that! I welcome the development aranym
might bring to our platform, as long as they stay compatible with with it.
What I have said, is that no matter how good an emulator becomes, the
mahcine running it is not an Atari/TOS clone.

>

Sometimes you have to pay to get the real thing, ya know ;-)

>
> What's the matter gents? Afraid to share your toys?

NO! I'm not afraid of such things. Btw, what gave this impression?
Because I (and others) refuse to call a PC, Mac or whatever emulating
Atari/TOS an Atari/TOS clone?

>

> I heard Unix?

The makers is to say what a platform is built for. As I have tried to get
across several times now, hardware is not relevant. Who built the hardware
is not relevant. What is relevant is the fact that the hardware was built
with TOS, to be an Atari/TOS compatible, to run TOS as its native OS.
That, and ONLY that, qualifies any given machine as being an Atari/TOS

clone.

>
> Well, AMD and Intel computers run GEM, DOS, Linux and Unix. Getting kinda
> gray here.

Yes, kinda gray area. Which system do they run as their Native OS?
Impossible to tell, I guess.

>
> AMD... is it built for Linux or Windows? Or Unix? Or GEM? Who determines
> what a piece of hardware is used for? The user.

AMD, the chips I know of, are Intel i386 CLONES! Geddit? Furthermore,
the vendors building machines based on these CPU's have Windows in mind
when creating the machine. How do you think a i386 based computer would
sell if it was not able to run Windows? Ergo, its a Windows machine!

>
> If I wanted to put Mac OS on it, sure I could. I could make it an Amiga, I
> could make it a TOS Box. It all depends on me.

If you could put Mac OS on it, it would be a windows machine running Mac
OS. If you could run AmigaOS on it, it would be a Windows machine running
AmigaOS. If you run Linux, on which you run Aranym to make it TOS
compatible, its STILL a goddamned Windows PC, not a clone!

>

Noone has cast it off as not being good enough. Altho I have to admit not
liking the idea of emulation, and I keep dreaming about new, dedicated

hardware to run our OS, I understand the value of the aranym project. Just dont call a machine an Atari/TOS clone when its not!

Specifically certain people who refuse to associate the word emulator
with aranym. No one initially said it was a crock. If you sling mud,
it often comes back, reread the thread.

> To matter the fact, if I didn't know better, I would say that our users

Your numbers are way off, but doesn't matter. The AMD is not hardware
designed for TOS as you new subject line states.

> What's the matter gents? Afraid to share your toys?

Afraid to spend money on a real toy?
Alot of people are just to cheap, take the easy route and beat down
what they cannot afford to justify their actions.

How about this:
Vintage= blah...
Special= actual clone blah...
Emulator= Yeah the dreaded word EMULATOR! Say it, it will not kill
you.

> Now while an AMD can never be a vintage computer, to simply cast it off as
> "not good enough" because it was "made for something else" is a crock! You

I never said it was a crock, if an emulator (aka fake atari on a host
system) is what you are after, fine. Whatever, but I will not accept
it as a platform
or as a clone. Apparently some people are so desperate for something
their judgement gets warped. I feel sorry for some of you.

> NO! I'm not afraid of such things. Btw, what gave this impression?
> Because I (and others) refuse to call a PC, Mac or whatever emulating
> Atari/TOS an Atari/TOS clone?

What is PC?

Take modern CPU that is said to be compatibile wit i386. It does not run i386 command... starange? No, it interprates i386 commands and translates it into their native codes, then run it. It is most visible in Transmeta CPUs, I think that they have been asked to crate m68k compatibile layer to their CPUs but they are not interested.

What does it mean? Truth lies in the middle. Even i386 CPUs emulate some things (take 8080 compatibility - it is all emulated), so Aranym is just an aditional EMULATION LAYER that creates a TOS compatibile PLATFORM.

It is both a PLATFORM, an EMULATOR and a CLONE.

Why clone? Take Milan, rip out TOS and what do you have? A m68k based machine that can run anything with no relation to Atari hardware at all... the TOS ROM makes it Atari clone.

I see the same wars on Amiga scene. They have UAE and Amithlon (emulators) and on the other hand Pegasos and very-soon-coming-out AmigaONE (hardware). Emulators are m68k compatibile (there is no Amiga PPC emulator avialible yet), and hardware platform is PPC ompatibile. It creates much bigger problems than we have even with one CPU type.

There will be alwas an argue between emulators and real-hardware fans. Personally, I prefer original hardware, but if it is not avialible for me for some reason, emulator is ok too.

So let say it loud: Aranym is an EMULATOR, PLATFORM and a CLONE. All together. There is no need to waste time for arguing.

This is one of the most flame ridden things I've seen from you in awhile lp.

People want a fast atari desktop.

Last I looked...

They were making no more Hades

Last I looked...

No one had received a CT60

Last I looked...

ACP was not shipping a board

I could go on.

I'll go back to what I said originally.

Full 060's are a thing of the past and what ones exist are over priced for
their performance.
Any future 'Atari' compatible hardware, is going to have to emulate they
system at some point.

There are major differences between a product like Aranym and a product like
Steem. I feel a bit

sorry myself for someone that has such a need to claim they own the fastest atari possible, that they
are unwilling to see the differences. Maybe if you shut your iMac off for a few days and went back to
using your Hades, you would be wishing for a bit more speed as well.

> > It's a closed mailing-list and the subscription was rejected.

Well I deleted all the private e-mails about the subscription. There
was no point in keeping them. However I will tell you that I received
a rather defensive e-mail about the subscription, how I was close
minded, how I'm trying to hurt the platform, before I even got the
actual subscription notification. Personally I think they were out of
line, he knew he would not be welcome on such a list yet applied
anyway. And this person listed their PC equipment and claimed it a
clone. Which I will repeat for the ump-teenth time is not a genuine
clone. It is in fact a PC with yet another emulator.

> Unless one of the team members actually told you they thought Aranym is a clone, you're
> conclusion is invalid. The individual may actually also be interested in clones, or just
> wants to make sure Aranym will run on them.

Then they need to go find one and buy it. The mailing list is not for
pre-newbies asking alot of questions. The entire reason for the
mailing
list is to get a group of people together who already have clones. To
avoid the crap that goes on here and stuff like... "where can I find a
milan type posts".

> Either way, the squabbling over what is and isn't a clone is really pointless. It gains
> no one anything.

I for one think you all are the ones squabbling, I mentioned the word
emulator and every one goes off. It's actually funny to some degree.
However I won't be silent, don't like my views then please add me to
your kill file. Aranym is functionally the same as magicmac as far as
I am concerned, the only difference it is allows one to use mint. The
bottom line is there is still an underlying OS the is completely not
related to the Atari.

> One of the messages commented about original OS's or something like that. Well, don't
> forget that DOS has CP/M roots, and Apple stole the mouse/GUI idea from Xerox.

on
> MS machines?

You can keep yapping about the past, it's also pointless.
Milan, hades, DOS, GEM, whatever has nothing to do with my original
comment that aranym is an emulator. Wake up people.
Is it so hard to just agree that it is an emulator?

> If everyone would have put as much effort in trying to get someone to buy an Atari system

Yeah, duh! Did my original post claim otherwise? No.

> There are major differences between a product like Aranym and a product like
> Steem.

That I agree with. However it is still an emulator.

> I feel a bit
> sorry myself for someone that has such a need to claim they own the fastest
> atari possible, that they
> are unwilling to see the differences.

Where did I say that? I did not.
I see the difference. I think it's sad that you have chosen to attack
me when I've not said one bad thing about aranym, please re-read all
my posts and you will find that all I said was that it is in FACT an
emulator.

> Maybe if you shut your iMac off for a
> few days and went back to
> using your Hades, you would be wishing for a bit more speed as well.

That's a low blow, quite frankly uncalled for. So now you attack
someone who actually put forth the effort to support Medusa. You are
pathetic. Could you please go back to my original TINY post and just
re-read it and see that all I said was that aranym is an emulator?

Either agree that aranym is an emulator in it's current form and let
it go at that, or redirect further offensive posts at someone who
actually said something negative about aranym.

Dear Lonny!

I am so glad you defined what's an emulator (has underlying foreign file system) and what's not (100% tosfs through and though).

Thanks to that I am entitled to declare that aranym is not an emulator! :-) Yes, you read me well. My aranym here reads/writes my original Atari Falcon harddrive directly with no foreign file system involved.

Thanks again and see you soon in aranym-user mailing list (note that we don't kill subscribing users - the list is open to anyone!)

Petr

P.S. Surprisingly my aranym host machine has nothing to do with Intel and Windows we both hate. It's a pure K7 XP+/Debian Linux machine, actually it used to be as aranym has turned it into a TOS machine.

F>they are German models so I think TOS/GEM will be in German and the
F>keyboard wont be QWERTY does anybody know how to go about converting to
F>English
You could replace the TOS eproms with english ones. Or, you could
install some soft that allows you manipulations of keyboard settings.

But both "solutions" will show the disadvantage that the characters
shown on the keyboard won't match the characters you type.

I think the best is to replace both the keyboard _and_ the eproms.

Message-ID: <ap4fd5$4eh$1@ns.felk.cvut.cz>
Source record: 31474

Hi all,

if you're looking for an upgrade of your aging ST/TT/Falcon and are considering aranym as your next TOS machine then please read on.

While aranym runs on wide variety of hardware you would probably go for well known 'Power without the Price' and that's currently a cheap but powerful PC hardware. For maximal speed you will want to enable the aranym's JIT (just-in-time) compiler for CPU. The important information is that you should stay away from Pentium 4 host CPU in such case. While Pentium I-III generally work well the Pentium 4 is incompatible with them and with the JIT compiler.

You'll do best if you simply follow the old Atari users' rule "Intel Outside!" and buy a machine with an AMD CPU (Duron, or better Athlon). For same or lower price you'll get more power and no problems with JIT. The rest of hardware setup is not very important - if you want lotsa memory in your TOS machine then buy lotsa memory for the host machine and similarly for harddrive, CD, sound etc. You can also re-use your floppy, harddrive, CD-ROM, monitor and everything else from your old machine if you're building the new machine from pieces.

And the last note: if buying a new PC get one without Windows - you don't want to pay for a windows licence when you don't need it, right? Wintel Outside still rulez.

Petr

Hi Greg

| Saw an add for a cartridge that would break the source code of any ST
| program. I was thinking if so, this would be helpful in porting ST games to
| the Atari Jaguar.
|
| But I dygress, can anyone tell me about this? Does anyone have one to
| sell?

I'd have thought that TT-Digger would do that, its a powerful software application.

There are a couple of pieces of software for the ST that remap the
keyboard (the silk screening on the keys will still be wrong, of
course!). Try ger2eng.prg and keyb_sys.lzh, both of which should be
in your email by the time you read this.

>wrong? Or is Aranym just an advanced "Basilisk" tailored for TOS?

The way I understand it, that's exactly the goal. Aranym running on top of Linux is merely an interim step. Aranym running on top of Linux is an emulator. Aranym running natively on Intel silicon is more than an emulator.

I think this discussion of what technically constitutes a "clone" is silly, and misses the point. The important point is that an Atari OS (whether or not the Atari OS was ever "pure" to begin with, or whether or not a bona-fide Atari TOS version (M68K binary) is involved) is operating the underlying hardware on its own, without the assistance of some other OS. Secondarily, having applications running natively on the hardware is an important goal, although running existing applications (M68K binaries) via an emulator (in exactly the same way M68K Mac binaries are run on PowerMacs) is an acceptable interim step.

I don't like emulators. I see their value, but I don't regard them as an acceptable option for a primary-use OS. An OS is supposed to operate the hardware, directly.

I don't really like the Intel peecee architecture. Part of the charm of Atari is that it is DIFFERENT from the ubiquitous peecee. I intend to get a Coldfire when they appear. But in the meantime, and realistically for most people, an Intel-based platform running an Atari-derived OS is acceptable, and still preferable to emulators.

Now, if my understanding of Aranym is wrong, or if the Aranym developers have tacitly opted to drop the long-range goal of running natively in favour of the easier status-quo of running on top of Linux, then Aranym is an emulator, period. And I'm still waiting to run an Atari-derived OS on my cheap peecee.

(which is NOT a Windows box. Never had Windows. Never will.)

If this person knew he/she wouldn't be welcome and applied anyway, sounds like that person was trying to prove something to someone, or justify some point of view.

See below about emulator/clone thoughts I have.

> Is it so hard to just agree that it is an emulator?

I hadn't been following much of anything lately regarding clones, emulators, etc. But I went and took a look at ARAnyM's site, and I agree with you, it's an emulator. Some part of Linux is required underneath ARAnyM for it to run.

That said, I think it boils down to just two conditions. Take the processor of your choice, motherboard of your choice, whatever is there that's hardware of your choice, if Aranym has to have Linux or part of some other OS installed before it runs, then it's an emulator. But, if ARAnyM did not need any part of any other OS to run on that very same set of hardware, then it's a clone.

Heh!!! It just occurred to me Lonny. There's probably at least one person out there who would insist that unless it was on a Motorola chip (68000) series, it would not even be a clone. And from there, you could say that a PPC based Mac isn't even a clone of the original 68000 based Macs. <G> Boy, could we really get an argument going there!

Yes, and logical chips in Milan emulate MPF. But that is not the
motherf****ng point! The point is that this hardware was put together to
run TOS. Confusing, eh?

Lonny,

My apologies if you believed that my message was entirely and solely intended for you. Your name was included on the message for the sole purpose of continuity, flowing from one idea to another.

I realize that you have a one track mind, and for such over taxing of your brain I once again apologize. Go back to your over priced computer and your exclusive way of thinking, and know that your Hades will be and for always safe in your pocket of the world, in your city, and in that little place you call home.

You are also allowed to exclude people from your mailing lists based on your one track mindedness and exclusive thought. Heaven forbid we should share our toys or listen to the ideas of others.

Be well (pats Lonny on the head)... now run along and play....

More next message...

3032. Atari OS for the Intel/AMD Hardware [A Programming Challenge]

Newsgroup: comp.sys.atari.st
Date: 2002-10-23 07:54:44 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <007827b1@fmlynet.org>
Source record: 31494

FamilyNet Newsgate

Listening to good lot of people here, both those of the vintage crowd, and those of the non-vintage crowd, and hey, even Lonny, it would appear that the definition of a "clone" in a computer that runs an Atari OS SOLELY. This is understandable, and quite frankly, I would love to run an Atari OS solely on a AMD 1.2 ghz computer. Would be interesting. Maybe even effective.

While we have MagicMac and MagicPC, it is true, we always have to worry about the host OS giving out under the simulation. And the same goes for emulators.

With this thought in mind, I would love to encourage the programming community to make a stand alone operating system, making the Atari OS environment possible on the Intel/AMD platform. And an eventual goal would be to make modules that would translate for blitter and motorola processors to allow for older programs to work.

With this, the Atari OS can go from a computer owned by a few to a OS that will be another choice (though a choice behind the technology curve granted) along side Windows, Linux, Unix, Dos, GEM, etc.

I know I don't have the know how to do this, but would love to hear any comments on this.

Be well everyone,

Doctor Clu
Atari user from Dallas, TX-USA

Hallo
Leider kann ich mein eigenes Programm immer noch nicht selber testen, da sich STING weigert bei mir zu funktionieren. Zwei ß-Tester haben mir folgendes Problem gemeldet. Beim Laden der Gruppenlister per NNTP Befel LIST tritt ein Abbruch auf.
Es passiert folgendes, ich hole einen Block nach dem anderen vom Server und schreibe ihn gleich auf Platte. Jeden Block hole ich so:
Zuerst warte ich bis etwas da ist, max aber 3min:

```
while(labs((lenPrt=CNbyte_count(SocketHandle))+1)==1 && time(NULL)<to);
```

Das seltsame Konstrukt am Anfang dient dazu -2 (E_NODATA? und 0 gleich zu behandeln. In to steht die Abbruchzeit.
Dann lade ich den Block per:

```
CNget_block(SocketHandle,recBuf->ptr+len,(int)lenPrt);
```

auf die Art werden mal 30kB mal 100kB übertragen, grundsätzlich funktioniert es aber. Doch dann gibt CNbyte_count plötzlich Fehler -9 also:

```
#define E_BADHANDLE -9 /* Bad connection handle used. */
```

zurück. So wie ich es verstehe müßte sich also SocketHandle verändert haben, z.B. durch einen Speicherfehler, dies ist aber ausgeschlossen, da laut LOG-File sich der Wert nicht verändert hat. Wie kann es also sonst zu dieser Fehlermeldung kommen?

Just so I get this right John, you can plug a guitar into the falcon,
and using cubase to moniter, play the guitar with effects, live, or do
you mean record the input into cubase, and apply effects that way.

Thanks.... Rob

This does not matter at all, but the MFP is not emulated on the Milan -
there is a real MFP chip on the board. The PSG is partly emulated.

Hello Atari users,

I made 2 simple programs using system functions to access the video hardware. One uses the VDI, the other uses the XBIOS: http://membres.lycos.fr/pmandin/download/video1.zip (98Kb).

I would like people to test them, specially if you have non standard video hardware (VDI, clones, external video board, Blowup, ScreenBlaster, etc...).

If you want to do a report, please give a maximum of infos about your machine: (ROM, VDI, hardware extensions, cookies present, etc...).

I need documentation for this:
- MVDI (Milan VDI with XBIOS extensions). I have a simple doc, but there is no info about how to detect if it is present or not.
- NOVA (Nova VDI with XBIOS extensions). I do not have any doc, if you have it, send it to me.
- Blowup, ScreenBlaster, others screen enhancers: Send me docs.

The goal is to add support for these extensions in SDL.

>>TSR to remap hardware if needed,). that'll be the day.

There is work being done on a bootable CD that will allow you to do
just that with ARAnyM. The 'TSR' in question will be a Linux kernel.

>>I understood that the original idea about Aranym was exactly that, am I
>>wrong? Or is Aranym just an advanced "Basilisk" tailored for TOS?

Well, the CPU emulator and JIT compiler are mostly the same as in
in BasiliskII (and UAE and Amithlon for that matter).

>The way I understand it, that's exactly the goal. Aranym running on top of
>Linux is merely an interim step. Aranym running on top of Linux is an

Not really.

Writing a new set of actual hardware drivers would simply be insane.
Besides the obvious problem that not everyone has the exact same
hardware, there is not even documentation available for everything.
Not to mention hardware dependence, development time, performance etc.

Why would it matter that a driver is called via a standardized
interface (Linux, or whatever) rather than via something similar that
we have written ourselves?

>emulator. Aranym running natively on Intel silicon is more than an emulator.

ARAnyM is running natively on AMD/Intel silicon, and on Sun silicon,
and on MIPS silicon, and on PPC silicon...

No one is arguing that ARAnyM does not emulate 68k instructions (it does
not, however, emulate any actually existing 68k CPU, even though it is
mostly an '040). It obviously does that (well, not all the time if you
use the JIT compiler).

It even emulates some Atari hardware, though not really any actual
Atari machine. Mainly to be able to boot TOS 4.04.
All of that could be thrown out, however, if we provided a few more
NatFeats (Native code features accessed via normally illegal
instructions. This is how the accelerated graphics, sound, etc already
works.) and modified EmuTOS appropriately.
So, ARAnyM+EmuTOS could be TOS compatible without emulating a single
piece of Atari hardware. Obviously this does not work for software
that goes straight to the metal, but that problem is not specific

to a virtual machine.

>and misses the point. The important point is that an Atari OS (whether or not
>the Atari OS was ever "pure" to begin with, or whether or not a bona-fide

Comparing GEMDOS with MSDOS int21 is kind of interesting. They mostly
even have the same function numbers for equivalent functionality! ;-)

You might consider TOS an MSDOS clone (or perhaps they are both
really CP/M clones).

Of course, you can easily argue that neither MSDOS nor TOS is an
operating system to begin with. Program loader and function library
covers their functionality pretty well.

>Atari TOS version (M68K binary) is involved) is operating the underlying
>hardware on its own, without the assistance of some other OS. Secondarily,

No modern operating system is handling any significant amount of
hardware on its own. That is left to device drivers.
For some operating systems, those device drivers are (or at least can
be) user mode processes. The device drivers might be implemented in
interpreted BASIC if the developer thought that was a good idea for
some reason.

>having applications running natively on the hardware is an important goal,

Among the ARAnyM developers, I've been pretty much alone in arguing
for native code support in applications, actually.

>acceptable option for a primary-use OS. An OS is supposed to operate the
>hardware, directly.

How would you notice?
A bootable Linux/ARAnyM CD could be configured so that you would have
no way whatsoever to find out there was a Linux, or even a non-m68k
CPU, somewhere inside the computer running your Atari programs.

>most people, an Intel-based platform running an Atari-derived OS is acceptable,
>and still preferable to emulators.

I really doubt most people value TOS itself above their applications.
If someone does, he should be just as happy with MSDOS (and PC-GEM if
he's into GEM applications) unless he's an assembly programmer.

>Now, if my understanding of Aranym is wrong, or if the Aranym developers have
>tacitly opted to drop the long-range goal of running natively in favour of the

ARAnyM itself will always run natively (well, unless you run it under
an emulator ;-). It does not contain any operating system that could
run natively or otherwise (although it could be bundled with EmuTOS,
but see below).

There has never, to my knowledge, been any plans to run native code
applications under ARAnyM.

(The PC-GEM folks have been talking about adding m68k support, though,
so you might be interested in checking that out.)

>easier status-quo of running on top of Linux, then Aranym is an emulator,

An emulator of what? ;-)

>period. And I'm still waiting to run an Atari-derived OS on my cheap peecee.

Since TOS really does not do much worth mentioning, it is pointless
to compile it for x86 if your applications are m68k code. The slowdown
from running it under emulation is miniscule, assuming a few native
code device drivers (mainly graphics).
TOS itself, being mainly a function library, has no concept of device
drivers, of course...

Anyway, it sounds like you might be happy with PC-GEM.
The hardware support is of course lacking, for reasons as above.

>cost to upgrade from my current version to something that works with
>MacOS 9.x?
>
If you already own a previous version not so much I think ...... just
look at the ASH page:
http://www.ash-software.de/atari/

But you must know it's also possible to run OSX on your machine with a
minimum of hassle installing XPostFacto which will allow your "old"
computer to run the new system ...... Only you must have a compatible
graphic card like an ATI Radeon or older 128 one.
It already exist an OS X version of MagiCMac ......
BUT don't expect to run any musical application using MIDI interface
.... a pity but that's all you won't be able to use.
MagiCMac is great at using Calamus and everythingelse ....
If you need more information let's talk I'm using a 8600 which is the
same computer than yours excepting I only have 3 PCI slots and I have
Audio + Video Inputs and Outputs that the 9600 don't.

Jo

For XPostFacto 2.2.4:

Very well said. Anyone can buy a PC components and put them together to
have an Aranym box. One can also to found a company which will sell PC
machines with
preinstalled Aranym OS.

Or do you want to say that Milan is more than an bunch of PC technology and
some standard PLD devices with specially written TOS on the top ?

Ctirad

if you don't mind that no applications would be available then simply port the EmuTOS (it's mostly C code now, so a recompile might work for most parts) and you're done. Oh, well - missing hardware drivers. You might spend some time by writing drivers for your hardware - just like Linus did in 1992 (?) for this PC 386 with IDE drive and VGA card. Or you may realize that using someone's else work is a cool idea and use the linux kernel thingy to drive the underlying hardware for you. It would save you about 10-20 years of development time.

I think you have basically listed the goals of one camp in the Aranym project. As Johan mentions in another message of this thread, running native applications under Aranym has been/is considered. Some people are not ready for the switch yet, some were since the beginning.

It depends - without JIT the CPU emulation might have been slower a bit but now, with JIT, there's no longer a problem with the speed so it's a question if native applications are really required. Maybe when the user base of aranym is large enough they'll start asking for native apps. Let's see what future will bring. We didn't close any doors, everything is open

for future (even the source code :)

There are just a little problem this version is 7 or 10 times slower
than the version under MacOS 9.x, for example it's not enough for play
divx files. Under MacOS X now Aranym seems a better solution.

Regards,

Didier.

Source record: 31409

Hi All,

There's been a lot of postings recently on emulators, clones etc. As I understand it there is no way to run any of the dongle protected programmes such as Cubase with an emulator.

The dongle port and built in MIDI interface is an important feature of the Atari. My Hades has a card which takes the dongles and Cubase runs a treat on it (not sure about Cubase Audio, but I think it is possible at a price).

To me no emulator can be considered an "Atari" unless it fulfils the basic functions of an Atari. Can it be done with Aranym ? Will it be possible on the Coldfire ? (I do hope so).

Cheers

Paul

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmh@netzero.net for
more info.

Last updated 10-23-02

HARDWARE

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor $250.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual. $25.00

Atari Portfolio 64K Memory Card. This unit is new but I can't
guarantee that the battery is still good due to it's age. $5.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $10.00 each.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*

Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*

GAMES

Annex by D. Pritchard. An DOOM Alien shootem up game.
Docs, disk $5.00

Bridge 4.0 by Artworx. A comphrehensive contract bridge-playing
program. Box, docs, disk $5.00

Captain Blood by InfoGrames. An involved space game of exploration.
Box, docs, disks. $5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room
castle in this huge adventure game. Comes on 5 floppies.
Comes with box, docs, and disks $10.00

Leather Goddesses of Phobos by Infocom. The famous text adventure
program. Comes complete with box, disk, docs, 3D Comic Book,
3D Glasses.... $15.00

Magical Math by Atari. The scholastic series math tutor program
starring Bentley Bear. Box, Docs, Disk $5.00

Mickey Mouse The Computer Game by Gremlin. Help Mickey rescue
Merlin's Magic Wand in the enchanted Disney Castle.
Box, docs, disk. $5.00

NightBreed by Ocean. A game based on a Clive Barker book/movie.
Box, docs, disks. $5.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in
one and two player modes. Comes with box, docs, and disks $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $5.00

Planetarium by Atari. The scholastic series observitory in your
own house. One of the better if not best scholastic programs by
Atari. Comes with box, docs, and disk. $5.00

Quartet Gold by Red Rat Software. 4 games in this box, Pengy,
Cosmos, Screaming Wings, The Secret of Steel. Pengo
clone, Galaxian Clone, 1942 Clone, and a graphical adventure.

Box, docs, disks. $5.00

Renegade by Mastertronic. A Star Raiders type space shooter
type game. Manual and disk. $4.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk. $5.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Sinbad and the Throne of the Falcon by Cinemaware. Docs and disks $5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks. $5.00

Stir Crazy by InfoGrames. A 6 Games in 1 adventure featuring
BoBo the prisoner. Box, docs, disks. $5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Transartica by Silmarils. A Falcon030 game where you are
the captain of the a Train on the frozen planet. Docs, Disks. $15.00

Xevious by Mindscape. The famous arcade game. Box, Disk, Docs $5.00

MISC SOFTWARE

Copy II ST by Central Point Software. Make backups or copies
of most ST floppies even protected disks. Manual and disks $5.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual. $5.00

DC Shower by Double Click Software. Replaces the TOS "Show" button
when double clicking on a file from TOS. Many different types of files
can be manipulated like graphics, compressed files, and HEX.
Docs and disk $5.00

Degas by Batteries Included. The classic graphics and drawing
program for the Atari ST platform. Comes with book and disk $5.00

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.
For more info please goto

http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope. $30.00

Easy Draw by Migraph. A professional drawing program for the ST.
Features include multiple drawing windows, specific drawing area zooing,
desktop icons and much more. For color and mono systems.
Box, docs, and disks. $5.00

Flash by Antic Software. Complete Gem based telecomunications program.
Has VT-100, CIS, Vidtex Graphics capabilities and more.
Box, docs, and disk. $3.00

Image CAT by Wiz Works. The complete graphics cataloging system
for all Atari computers. Print a catalog of image files that you
have on your Atari or view the images on your screen. Docs and disk $5.00
MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
This is a boxed Atari version and not the pack in with the Falcon.
Comes complete with binder, manual, and on 720K floppies $15.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Box and disk $3.00

Stalker 3 by Gribnif Software. A great GEM based telecomunications
package. The most complete telecomunications and terminal program
produced for the Atari. Can be run as a desktop accessory which then
allows background downloading and more. Box, docs, disk $5.00

Thunder by Batteries Included. Sophisticated writing tools including
spell checker, speed-typing word expander & corrector, and statistics
on your document like the number or words, lines and more.
Manual and disk $5.00

Time Link by Batteries Included. A time management software package.
Keep track of appointments and see them by the day, week, month,
or year. Manual and disk. $5.00

True Paint by Oregon Research. A true color paint package fro the
Atari computers. Supports many file formats IMG, Degas, Neochrome,
IFF/ILBM. Targa, TIFF, GIF, JPEG and more. Works on all Ataris with
1 Meg of RAM or more. Box, docs, disks. $10.00

Ultimate Virus Killer by Oregon Research. Protect your ST and repair
progarms that were infected. Manual and disk $5.00

Wordflair II by Goldleaf Publishing. A very powerfull word processor,
desktop publisher, and document processor. There's almost nothing that
you can not do with the program. Requires GDOS or NVDI.
Box, docs, and disks $10.00

WANTED

MagiC Mac Ver 6.XX
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,
OS/2, Mac, BeOS, NeXT, and Amiga. If interested please request a list.

>Thanks.... Rob
>
>
>

Hi Rob,
The Falcon audio input would need to be fed by the audio out of an amp, mixing board or other source (such as standard outputs with 1 or .7 volt) that is fed by the guitar. As far as effects go, I never used Cubase for that so I'm not sure if it's effects work for audio, MIDI or both! Maby someone else can give that answer.

From: Ctirad Fertr <phanatic@SPAM>
Message-ID: <ap79tp$9mc$1@news.vol.cz>
Source record: 31414

```
> There's been a lot of postings recently on emulators, clones etc. As I
> understand it there is no way to run any of the dongle protected
> programmes such as Cubase with an emulator.
```

There are two possible ways how to use dongle keys on machines without ROM port.
First way is to use an ISA/PCI/VME ROM port adaptor. Second way is to simulate the dongle key (e.g. grab it into binary file if it's a kind of (E)(P)ROM and then map this file ROM port memory area).
And, of course, third possibility is to modify a program itself to be able to work without dongle key (read: use a cracked version).

```
> To me no emulator can be considered an "Atari" unless it fulfils the
> basic functions of an Atari.
```

```
Actually, any well written ST emulator can run all ST software as well as
the real ST machine, or even better, because you can to switch between
various setups/TOS ROMs/etc easily. That is, because the goal of emulator is
to emulate every aspect of the original *hardware*, even with the
unoficcial/undocumented "features" usually used by demomakers or game
makers.
```

However, Aranym philosophy is completely different. The goal is not to emulate original Atari hardware. It's about forwarding TOS OS calls directly to hardware drivers. In fact the goal is to write an portable TOS compatible OS with built-in 68k emulation for "old" Atari/TOS applications.
That's not all, though. It's also about adding a new features into this OS. Do you want multiple audio inputs/outputs with 24bit samples support ? Do you want multiple video output ? Do you want hardware OpenGL ? Do you want USB, FireWire, TV card, or even VST like plugin system ? Let's design an easy-to-use and efective API for these features and add them into Aranym OS.
Aranym is the first (and also the last!) chance for Atari/TOS users to have an modern opensource OS runnig on a most modern hardware. It allows anyone to add a new features directly into OS. It's open.

```
> Can it be done with Aranym ? Will it be
> possible on the Coldfire ? (I do hope so).
```

I doubt. These appliactions depends so much on original Atari hardware (real or emulated).
I have many experiences with CAF and Digitape2. They are excellent when run on a falcon, but nowdays I no more want to reboot into "clean" TOS. I also don't wan to partition 80GB harddrive onto many 500MB partitions in archaic FAT16 filesystem to make this software happy. I would rather to see something new, fresh and modern.

> (which I still think is a good machine by the way!). I might upgrade to
> MacOS 9.2 though as a more experienced Mac user than me has recommended
> this, and it's apparently free.

you'll have to note that 9.2 won't run on your machine unless you do
some hacking or run it within OS X 's Classic layer - Apple purposely
engineered it so that it'll only run on Macs with a built-in G3 and up.
I tried installing 9.2 on the UMAX and had it completely crash the
machine so hard I spent hours slowly getting the drives to remount by
re-installing the drivers from 9.1 .

I'd suggest if you do want to run OS X get 10.2 (Jaguar) running on
your machine, I've been running it for about a week now and it's fast
and VERY stable. Use XPostfacto 2.2 for now, though, as there's a bug
that causes a kernal panic upon boot on later versions. BTW, Ryan
Rempel, the guy who does XPostFacto, is a real cool guy to have figured
out how to get past Apple's roadblocks to prevent OS X to boot on older
machines like your 9600 and my UMAX J700, I'm sure Steve Jobs probably
has him marked for death :) I met Ryan at Macworld NYC last July, he's
pretty knowledgable.

To get back on topic for the NG, though, it's interesting to see that
Apple finally got to play catchup to get an OS as good as MagiC 6 . Now
if only they could've figured out how to get it in 200MB of hard drive
space and 4MB of RAM like MagiC 6 did on my Ataris :)

I didn't know that someone's porting Aranym over to OS X - cool! I
want to check this out just to see if I can get Edith running under
Jaguar.....

You're missing two things:

1) aranym is not unix based. Simple proof: it runs also on Microsoft
Windows.

2) You are actually going to run Unix, even if it's called Mac OS X.
Inside it's true Unix.

Download the utility from http://www.macos9forever.com (I hope I've
remembered the URL correctly).

I used it to install OS9.2.2 on my Umax Pulsar.

Cheers

Derryck

If I was having a bad day and took more out of your message than I should
have. Please accept my apology.
I don't hate you. I like you and respect you, I've known you for years. I
don't agree with your reasoning though.
Several people don't agree with your reasoning. Your message stated people
that don't agree with your reasoning are desperate and warped.

You don't accept it as a platform. Fine. I really would have thought that
a PowerPC or Athalon MiNT box would have been right up your alley. If you
look at the developers and users that is what we are talking about,
they are MiNT users. Have been MiNT users and in many cases active MiNT
developers. It fits right in

with the MiNT philosophy being open source and adds in the new case of open
hardware.

Your line was
' Afraid to spend money on a real toy?'

These lines were here to say basically we can't spend money on a real toy.

If you are lucky enough to find a Hades in North America, you are going to
be
spending alot of money for an old used machine. They may go cheaper in
europe, but alot of us are not excited about spending 1 or 2 paychecks (or
more) for
a used machine. And that's taking into account they are about as common to
be found
for sale as winning the lottery.

The CT060 people have spent money for and right now it's over 6 months
behind delivery date.
I'm not saying he won't ever ship them, but you can't call anyone on the
phone and have them
ship you one today either.

ACP. I hope it succedes. I'd like to have one. But it's going to take
time before they are
available. And in case you missed it in the past, there will be a number of
people arguing over whether
it will be an "atari' or not.

>

> Yeah, duh! Did my original post claim otherwise? No.
>

So are we to state that the last and best atari clone was the Hades and
nothing else can ever be classified as such? I don't know if that's your
opinion or not. I get that impression from reading the thread.

> > There are major differences between a product like Aranym and a product
like
> > Steem.
>
> That I agree with. However it is still an emulator.
>

I don't agree with you based on a couple of basic points.

1. It is not intended to emulate the whole system. If everyone including
the developers etc were to classify it
as an emulator. I would be firmly of the opinion that it's close to the
worst emulator ever if we are stating it's
an ST emulator.

2. NATFEATS - Native Features. A driver etc does not need to be written for
the 68k cpu and run under the emulated CPU. It can run compiled for the
native architecture, whatever that may be. There has been talk in
the past of recompiling MiNT and others for the native hardware, so that it
would not run through the emulated CPU at all.

>

You quite voiciferously state your opinion that it's only an emulator. You
also quite
strongly state people who don't agree with that basically need to have their
heads
examined. Yes I've reread all your posts in this thread.

> > Maybe if you shut your iMac off for a

>
> Either agree that aranym is an emulator in it's current form and let
> it go at that, or redirect further offensive posts at someone who
> actually said something negative about aranym.

As I said at the top, if I was having a bad day and if took more out of your
message than I should have, then
accept my apology.

We disagree on certain things. My definition of a clone is much more loose
than yours. Your definition of what
is an emulator is much more loose than mine.

I didn't say you were crazy, warped or desperate. I did and do take
exception to your portrayal of people that
don't agree with you are crazy, warped or desperate.

For the record. I do not use Aranym. I do not develop Aranym. I do
believe in what they are trying to do.
Take a look at the developer list. It contains some of the most respected
programmers of recent years for
our platform. I view your constant dismissal of them and their efforts (re
read your posts in this thread) as
a bit of an insult to them.

This isn't a slam on ACP either. I respect them as well. Both groups have
set quite lofty goals, one or both of
which I plan to enjoy in the future.

A respectfully disagreeing,

Dan A
aka baldrick

Btw. it is not always clear-cut whether there is an "underlying OS" on a computer. Take, for example, Digital/Compaq Alphas. They can run OpenVMS, Unices/Linux and WindowsNT4. Yet when they are powered-up they first wake into a "console" environment. Software ("firmware") creating this environment is distributed separately from any main OS, is loaded into a non-volatile RAM and it is practically an OS by itself, even having a CLI which recognizes a number of commands, some of them being:

alloc boot bpt break cat check chmod clear
cmp continue crash deposit dynamic echo edit element
eval examine exer exit false free galaxy gct
grep halt hd help info init isacfg kill
lfu line login lpinit ls man memexer memtest
migrate more net nettest prcache ps rm run
sa semaphore set shell show sleep sound sp
start stop test tr true up uptime wc

Only upon issuing the command "boot" is the main system started (it can be set to autostart, too).

One can notice that some of the above commands are more-less file-related, e.g. ls, cat, man... which operate upon items not related to main OS or its FS, so one could even say that there is an underlying FS. Some functions are network related and an Alpha can contact other nodes on the ethernet even before it is booted. But, surely, one would not say that an Alpha running e.g. OpenVMS is emulating anything.

So, I do not see that the existence of a bare-bones subset of Linux (which a user would probably never see at all, anyway) should present any problem regarding the *quality* of operation of ARAnyM. If ARAnyM's *functionality*, when a person wishes to use it in whatever way a "real" Atari can be used, is not worse than that of a ST, Falcon or a TT, then what does it matter (sort of a Turing test)? Really, it is not important at all whether it is a clone, an

emulator, all of that or neither, and we are all spending much effort in a rather pointless arguing, sometimes verging on insults.

BBtw. as an example considering the quality of "emulation" (or whatever it is called), and as I was mentioning Digital anyway, there is a software product named "charon-vax" which enables one to create a fully-functional (including hardware interfaces) MicroVAX 3xxx environment on an Intel box and run, e.g. the latest version of OpenVMS at multiple speed relative to the "original" MicroVAX. AFAIK the owner of OpenVMS (HP, formerly Compaq, formerly Digital) recognizes charon-vax as one of the "legal" platforms for running VMS and will gladly issue a VMS license for it.

DV> emulator, all of that or neither, and we are all spending much
DV> effort in a rather pointless arguing, sometimes verging on
DV> insults.

You're speaking very truely. The discussion has "boiled over", with no result.

There are two opposing groups regarding the definition of "Atari Clone" and there seems to be no way to merge their ideas.

My first attempt to "manipulate" this discussion failed (no references to my posting), so here is the second (and last) one:

One group says ARAnyM is an Emulator, while the other calls it Clone.

To me it is more than an emulator as it aims at reducing the underlying linux-OS to the minimum, making the machine boot right into an Atari-OS (TOS/EmuTOS/MiNT...). But it still is pure software, running on "AnyMachine".

Let's draw the line between HARDWARE-Clone and SOFTWARE-Clone (or VIRTUAL machine, which sounds more descriptive to me).

Then it's clear that those machines that were formally called Atari Clones (Medusa, Hades, Milan, Eagle) belong to the HARDWARE-Clone section while ARAnyM is a SOFTWARE-Clone (or VIRTUAL machine), which stresses that it is far beyond the scope of ordinary emulators, a new class of system (and probably the future...).

Hi John

I misinterpreted your cubase answer then.
I'd be interested in using the falcon as an effects engine, if I
could.
I don't have a guitar (yet) but I do have a mixer to supply the
correct signal level, though I'd be more interested in sending my
synths through it if at all possible.
So, along the lines of the original question, could I use the falcon
as a live (as in, not record the final result) means of effects.
(when I say not record the result, I mean,I don't want to have to put
the input signal onto the falcon's drive, and then play with effects
on the recorded material)

THANKS Rob

I think the important points are, that while aranym will be a perfect upgrade path
for some people, it is not ideal to others. The discussion of the perfect defenition
of what is a clone and what is an emulator, is not very interesting at the end of the day.

Those that wish to use a hardware solution where the CPU and other components are closer
to the original 68k boards will not be too interested in aranym. Likewise, for a variety of
reasons the opposite may be the case to some.

The major problem is IMO the great lack of respect for people opinions though.
We don't have to force our opinions on each others. Even if someone wouldn't like
emulators,
they might be fine for others. And even if someone would only consider aranym, they don't
have to
discourage ppl interested in 68k machines. Perhaps something that some of the aranym
coders might think about a bit..?

About the mailinglist, I completely agree with Lonny that aranym is not fit for the
Atari Clone mailinglist he set up. Why? Well, it was initiated in an effort to bring
owners of dedicated hardware to share knowledge about them in particular.
Simple as that.

Regards,

Joakim

I know that the same DSP chip that is built into the Falcon was also used
in some stand alone
digital FX processing equipment. I don't know if someone ever developed
software for the Falcon to turn it into such a machine.

I think the full potential of the DSP chip hasn't been used as much as it
deserves by programmers. Cubase Audio was a good example. Aniplayer can
make good use of it. ACE MIDI is also a more recent good example of what
the DSP chip can do. A stand alone real time FX processor should be
possible, but hasn't been done yet as far as I know.

Hi Martin

I can answer that. He is Donald Skaggs and believe it or not a vital member of the Atari-MIDI community! He has been more then generous in supplying some RARE treats for download on TAMW, such as a 030 version of Tunesmith (he had the only one...it was made special for him by DR T software). He also helps out a lot on the Atari-MIDI forum when he can.He has also sent me several manuals and a Falcon Hard drive (when mine went out) for Free!. The manuals I needed to consult for creating tutorials for my web site. He is a BIG TIME Atari nut (as you can see from his Ebay postings: this is just his access stuff, and has lots more) Please forgive his numerous Ebay postings, but at least he is making these availbable for those Atarians who would like them.

> So all I really need is some good audio processing effects software:))

This is correct...
There are some applications out there that offer effects processing...
As for software dedicated to that soul purpose...I don't know of any.

Quite a few of the audio trackers have some dsp effects included.
Studio Son is one example of many hard disk trackers that do offer some fx processing capability. See my spill below on CueBase however...as the design and purpose of the software is similar in all such cases.

CueBase Audio Falcon, does have some built in effects that ALWAYS work REAL TIME when activated. The effects are processed last thing...and apply to the over all bus mix, which is set up with software mixer maps (the controls are set up like having an alesis or whatever hooked into a mixing console on the FX knob of each channel...) Don't expect anything super fancy however...these effects are quite good and fairly powerful...but...they are the basics, such as reverb, chorus, and eq. You can only use them one at a time. I.E. In the LIVE sense, you can NOT hook multiple effects parallel, or in a series from reverb to chorus, or have reverb in one channel, chorus in another, and an EQ on the whole master mix. You're limited to one effect, across the entire bus at a time. Again, all FX processing is done live just before the total mix gets converted to anologue and sent out the headphone/speaker port. The hard disk or ram tracks remain as dry as you recorded them. If you want to RECORD what you hear, FX and all...you have to set CAF to mix down a new track off the master bus.

In short...these FX are designed to be used in single passes in a multi track environment. I.E. One might first run EQ while bouncing off new vocal tracks. Then make another bounce to add some ambiant reverb to this ulra clean/dry vocal track. And so on...

The potential is definately there to make the falcon into a dedicated real time FX machine (with applications similar to a closet full of guitar petals or rack units). There might even be software out there that does just this, but if there is...I've yet to find it.

Here is a very valuable link to begin your search for free and shareware atari software ;)

http://users.pandora.be/tos4ever/atari/prg-ind3.htm

Happy hunting...and if you find anything really cool...drop us a line here on the groups and let us know :)

> Just so I get this right John, you can plug a guitar into the falcon,
> and using cubase to moniter, play the guitar with effects, live, or do
> you mean record the input into cubase, and apply effects that way.

You can do both...

All DSP effects in CAF are done live...and last thing (just before you hear it). In order to 'permenantly apply' these effects to something you have 'recorded' you must 'remix' to a new 'track' from whatever bus you've asked the DSP to process. In fact...a mistake alot of people make is quite the opposite...they wonder why an FX they've worked so hard to get just right is NOT being recorded in their tracks (Duu! I can hear the FX...so why is it recording DRY?!?).

First Think of CAF as seperate dedicated pieces of hardware like this.

One 8 or 16 channel 8 bus mixing console with two physical inputs and two physical outputs. In essence you have the guts of a 16 track, 8 bus digital mixer, but just one set of physical analogue jacks (in L/R and out L/R) that are assignable to anywhere on your virtual mixer. It is possible to add more physical analoge and or digital inputs to the Falcon with equipment such as JAM IN/OUT, or with an ADAT bridge...

One 8 or 16 track audio tape deck.

One MIDI sequencer.

One sync unit to tie the MIDI and Audio together.

And finally, one FX device.

When you activate the CAF FX, you choose either EQ, Reverb, or Chorus. You then set it as you like, and tell it which of the 8 output buses you want processed, and how much. This works very similar to the way the FX send knob on a real mixing console works. In general...unless you add extra A/D/A converters to your Falcon, CAF treats the built in Falcon's headphone/speaker jack as the 'master bus', which is usually the one studio engineers will use to monitor the total 'master mix' of all that is going on in the studio...this is where the 'final mixdown' will eventually come from (okay, even if you do a fully digital mix down...this is what the engineer's EARS will HEAR from a monitoring perspective). All of this mixer channel and bus activitity is somewhat configurable depending on your equipment and needs.

So to answer your question...
Yes...you can hook your guitar into CAF, play, and hear an FX processed sound without recording anything. DSP FX are always REAL TIME in CAF.

Just be aware that the FX options offered by CueBase Audio Falcon, and other audio trackers are NOT anything like having a box full of nifty guitar pedals to

play with and hook in any order you want to play LIVE through. You get the basics, and you can only use them one at a time as the very last step along the selected bus(es).

Hope this helps,
Brian

From what I've been reading, those holding out against calling Aramyn a clone do so on the basis of the background code being loaded from disk rather than chip. If the Aramyn team put the necessary low-level code on a chip on the motherboard so that the system would go to the TOS desktop with no hard drive installed, would it then be a clone?

I don't have anything against it, I just do not view it as a clone or
a platform.
Simple as that. I might even test it, but I cannot as I would need a
MAC binary.

My one track mind thinks "Atari" and at least I think!
Not so sure about you.

You totally don't get it do you? Are you 3 years old?
The mailing list is specifically for Hades/Milan users. In fact Stan
(aranym team member) agreed that if I allowed him to join with aranym
I would have to allow all other emulators to join. So thus the
mailing list would in fact end up not serving it's original purpose.
It would in fact end up with all sorts of windows and emulator
problems that would be utterly annoying to anyone with a real hardware
based clone.

That's what this forum is for.

I know your small brain is having trouble dealing with this, have your
mommy read it to you several times, very slowly.

> Be well (pats Lonny on the head)... now run along and play....
>
> More next message...

If it makes you feel better start your on mailing list and exclude
people such as myself. Won't bother me one bit. (coding pun) ;-)

> Doctor Clu

Perhaps 'Doctor Clu LESS' would be more acurate...

Please note I said "some people", it was not directed at anyone in
particular. Aranym to me is yet another emulator, so I labeled it, no
big deal. Suddenly it is assumed that I have some problem, because I
give it a label I somehow thinks it's a crock. That pissed me off.
Why the assumptions? Right there is where the thread went wrong.
My comments after that were then in responce to attacks.
Perhaps not so accurate in your case.

> Several people don't agree with your reasoning. Your message stated people
> that don't agree with your reasoning are desperate and warped.

I'm not alone, there is 20+ users on the Ac list and not one jumped
up and demmanded aranym be included on the list. I did not exclude
Stan based on my own single thought, the group was asked and it was
handled based on reponce.

I didn't use the word 'reasoning' and that changes the line
considerably.
I said 'desperate for anything', that's entirely different.

Please don't make assumptions about MiNT users. That is another
problem that happens all to often here. Let's not even go there. ;-)

That is unfortunate. Some things come down to just how bad you want
it.
That depends on the person I guess. $$ is not an ssue for me when I
set my mind to something.

The way you beat down the 060 in a previous post I'd have to guess you
find this path pointless anyway as well as overpriced.
I hope he delivers, I hate to see anyone get took.

> ACP. I hope it succedes. I'd like to have one. But it's going to take

Depends on the final design, it's purely speculation at this point.

You like to add words, I never said "best". Last one would be the
Milan as the Hades came before it. I cannot classify a peice of
software that runs on top of windows or linux as a clone. If you can,
good for you, use it.

And when I don't agree with you, you have to bring up my mac?
Interesting approach. I still think some need examined.
"Some" is not neccessarily you. ;-)

There lies the original problem. If you would of responded to my
first posting and just said you consider aranym a clone, it works for
me.

I'd of been quite ok with that. But no you had to dismiss the hades
as an emulator and some goofy comment about games. Obviously that is
not going to sit well with me, you had to know that, your responce
appeared to be aimed at provoking me.

You read to much into it. It's the best _emulator_ yet. Does that
help?
I'm not going to reread anything. Suffice it to say this is going
nowhere fast anyway.

Obviously. ;-)

In fact it's neither a clone nor emulator. It's an OS (at least it should be when it reaches mature stage).

> To me it is more than an emulator as it aims at reducing the underlying
> linux-OS to the minimum,

Actually, the fact there is an underlying OS or not has nothing to do with a fact that the software running above is an emulator or not. Imagine, you have some true emulator (ST, Amiga, SNES, whatever) which runs directly on some (different) machine without any underlying OS. It still be an emulator. Emulation is not about underlying things, it's about simulating (emulating) of hardware systems. On the contrary, if you have an OS written that way, that OS API (Gemdos, VDI, Xbios..) calls are directly forwarded to the real hardware (directly or via some kind of lowlevel hardware driver, like framebuffer in linux kernel) then we cannot speak about emulation at all.

BTW, if someone really dislikes Linux, then he/she can rename it to "LoDDfMfA" (Lowlevel device driver layer made for Aranym ;) and then nobody can say there is some underlying OS, he he :-)

Hi, I'm Ben Smith of Bravo Sierra Computers! Your Benefactor, an Atari Dealer. Offering Sales, Support & Service of Atari HardWare, SoftWare, Books & Accessories for the Classic Atari 8 Bit and Atari ST Computers plus the 64 Bit Atari Jaguar Game System. I am a Reseller of Used & New Atari Collections! Much of which were the Treasures of Former Atarians, Locked away in Dungeons, now given New Lives, offered to be sold as New found Treasure, back in Circulation in the Atari MarketPlace. Hidden and Forgotten, Now set free from the secret hiding places. Atari Heaven where former Atarians had left them to Die. Saving Wondrous Collections from being irretrievably Lost! As well as Saving entire inventories from defunct Atari Dealers, much of it +NEW in the BOX/BAG! After Languishing in Forgotten Warehouses, long abandoned by retired Atari Dealers!

I love saving my customers money! I mainly use Postal Delivery! I save money for my customers when using Postal 2-3 Day Priority Mail & Global Priority Mail. I use Packaging supplied by the Post Office for free and Pass on the savings. I sell Atari, I'm not in the Business of Profiting from Marking up on the cost of Shipping! And just like the Postal Service I avoid making promises I cant keep. The Post Office sends Packages by 2-3 Day Priority Mail. They don't promise 2-3 Days but they have a Good record of Following through! Once I receive payment, your order usually goes out the same Day! This is not a Promise, but like the Post Office I have a Good record of following through! Ask my Customers! I also have Libraries of Reference Books for the Classic Atari 8 Bit and the Atari ST Computers! I have ways of saving Money on Postage by Sending it Book Rate. I also have some tricks for saving on Postage when Mailing outside the United States! I Ship Atari anywhere the Law allows! If you dont come to me, I cant save you any Money!So check my HotLinks below, E-Mail me at atari@aracnet.com or call Ben anytime at (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

Got Atari Questions? E-Mail or Call Ben 24Hrs, anytime at (503)256-9974!
http://www.aracnet.com/~atari/numbers.htm Phone contact info and Hours!

Please Direct all Replies Through E-Mail to: BenSells@atari.org, atari@aracnet.com or atari@benjamin.net. If you can't reach me at benjamin.net see my E-Mail/Web/Phone info in my Signature at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on the web at http://www.aracnet.com/~atari/catalogs.htm

http://BenSells.atari.org or at Ben's Domain at http://www.atari.benjamin.net
Catalogs can be Requested by and Received Through E-Mail at atari@aracnet.com
BenSells@atari.org or atari@benjamin.net and Please Specify whether you want
Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

3085. TOS clones/emulators & Benchmark tests

Newsgroup: comp.sys.atari.st
Date: 2002-10-25 08:42:06 UTC
From: Martin Tarenskeen <nospam@zonnet.nl>
Message-ID: <Pine.MNT.4.31.0210251040220.92-100000@easymint>
Source record: 31444

Hi,

Reading the discussions about fast TOS clones vs emulators another subject came into my thoughts: benchmark tests.

There is a problem with the existing benchmark tests that I have seen so far (qindex, gembench, gemtest, zbench). All these programs are based on a similar principle. Let the program perform a certain action (calculation, graphics, etcetera) and repeat this action an x number of times. Then measure the time it took to do all that.

But the difference in speed between an 8 MHz ST, and an emulator running on a 2 GHz pentium PC is huge. This makes old benches that were made with the old ST in mind useless. The measured times would be very small, or even zero on such a fast system. On the other hand a new, similar, benchmark test that would be designed to measure higher speeds, using more repetitions and/or more complex tests and calculations wouldn't be very suitable for an old ST because the tests would take so much time.

My suggestion would be to develop a benchmarkt test that follows a different principle: It should measure the number of times a system can perform a certain action (calculation etc.) in a fixed time. For example 10 seconds. In that case such a benchmark test would always take 10 seconds, no matter if a 8 MHz ST or a TOS emulator on a 2 GHz Pentium IV would be used to run test. The precision of the test could be influenced by selecting a longer or shorter testing time value.

Martin Tarenskeen

You're right. My fault. The reason for the device driver (the underlying OS) we explained in other messages of this thread.

>> :-) Yes, you read me well. My aranym here reads/writes my original
>> :Atari Falcon
>> harddrive directly with no foreign file system involved.
>
> That's nice but it doesn't change anything from my point of view.

I knew that. I just wanted to let you know that aranym is able to do that and that's one of its advantages (which helps with the conversion from atari machine to aranym machine since you simply take your disk with you).

>> P.S. Surprisingly my aranym host machine has nothing to do with Intel
